**Certificazioni ATEX II 2 GD c k T4 e ATEX II 3 GD k T4    ATEX II 2 GD c k T4 and ATEX II 3 GD k T4 certification  
per i riduttori serie PG/PGA di PlanetaryDrives    for Planetary Drives series PG/PGA**

Comer Industries amplia la serie di riduttori PG/PGA di Planetary Drives con la gamma ATEX (da ATmosphères EXplosibles), in conformità con la Direttiva 94/9/CE che regolamenta le apparecchiature destinate all'impiego in zone a rischio di esplosione.

I riduttori serie PG/PGA ATEX sono idonei per applicazioni in aree con presenza di atmosfera potenzialmente esplosiva e con presenza di miscele gassose e/o polveri combustibili. La Direttiva europea 94/9/CE impone la certificazione ATEX a tutti i prodotti commercializzati nell'Unione stessa, indipendentemente dal luogo di produzione e dalle normative in esso in vigore, se installati in luoghi a rischio di esplosione, con l'eccezione di alcuni apparecchi.

I riduttori progettati da Comer Industries per applicazione in ambienti ATEX si distinguono per l'utilizzo di materiali idonei secondo le norme di riferimento ed impiegano parti speciali quali anelli tenuta olio esclusivamente in Viton®; anelli paraolio in Viton® con labbro parapolvere e tappi sfiatato con valvola a molla; utilizzo di olio e grasso sintetici, presenza di rilevatori adesivi termosensibili, spessori limitati della verniciatura e predisposizione per collegamento di messa a terra.

I riduttori PG/PGA ATEX vengono sottoposti a prove specifiche secondo quanto previsto dalle norme e sono forniti completi di specifico Manuale Istruzioni e Dichiarazione di conformità secondo l'allegato VIII della Direttiva 94/9/CE.

I dati tecnici dei riduttori ATEX sono indicati sul catalogo generale dei Riduttori serie PG/PGA.

Comer Industries extends the PG/PGA Planetary Drives series with the ATEX range (from Atmosphères EXplosibles) in accordance with Directive 94/9/EC regulating equipment intended for use in areas at risk of explosion.

Planetary Drives series PG/PGA are suitable for application in areas with potentially explosive atmospheres and in areas with presence of gas mixtures and / or combustible dusts. The European Directive ATEX (from French words: Atmosphères EXplosibles, potentially explosive atmosphere) 94/9/EC requires certification for all products marketed in the EU, regardless of place of production and local regulations in force, when installed in areas at risk of explosion, with the exception of some equipment.

Comer Industries specifically designed drives for use in ATEX environments differ from normal series mainly for the use of suitable materials as requested by the EU standards such as oil seal ring in Viton®; Viton® shaft seals with dust protection; breather plugs with valve; use of synthetic oil and grease; presence of heat-sensitive adhesive detectors; reduced paint thickness; arrangement for grounding.

PG/PGA ATEX drives are subjected to specific tests in accordance with the a.m. norms and are provided with an instruction manual in Italian and English language, including a Declaration of Conformity, as requested by attachment VIII, Directive 94/9/EC.

Technical data are indicated on the general catalogue PG/PGA series.

Comer Industries è leader internazionale nella progettazione e produzione di sistemi avanzati di ingegneria e soluzioni di meccatronica per la trasmissione di potenza, destinati ai principali costruttori mondiali di macchine per l'agricoltura, l'industria, l'edilizia e la produzione di energia rinnovabile.

L'Unità Operativa Planetary Drives & Axles è dedicata alla progettazione, produzione e commercializzazione di riduttori epicicloidali modulari, riduttori ruota e riduttori per rotazione destinati all'impiego su macchine operatrici mobili e impianti fissi industriali, assali rigidi e sterzanti.

Le trasmissioni Planetary Drives sono altamente personalizzate e l'ampia conoscenza delle applicazioni industriali unita all'elevata capacità progettuale consentono di rispondere alle esigenze del cliente con l'innovazione continua, la qualità e l'offerta di un servizio completo.

Comer Industries is a global leader in the design and production of advanced engineering systems and mechatronic solutions for power transmission, supplied to major manufacturers of agricultural machinery, construction equipment, industrial and renewable energy applications worldwide.

Comer Industries' Planetary Drives & Axles Operating Unit designs, manufactures and markets modular planetary drives, wheel drive gear units, planetary slewing drives for installation on mobile operating machinery and stationary industrial equipment, rigid and steering axles.

The planetary drive transmissions are highly customised and, thanks to extensive knowledge of industrial applications combined with cutting-edge design expertise, Comer Industries meets all customer requirements through constant innovation, quality and comprehensive service.

Comer Industries ist einer der führenden Entwickler und Hersteller von fortschrittlichen Maschinenbausystemen und Mechatronik Lösungen für Kraftübertragung und beliefert die größten Hersteller von Landwirtschafts und Baumaschinen sowie Industrie und Energieanwendungen weltweit.

In Comer Industries ist die Abteilung für Planetengetriebe der Entwicklung, Fertigung und Vermarktung von modularen Planetengetrieben, Raduntersetzungen und Rotationsuntersetzen für den Einsatz in verfahrbaren und feststehenden Industriemaschinen gewidmet, Starre Achsen und Schwenkachsen.

Die Planetengetriebe werden kundenindividuell gefertigt und dank der großen Erfahrung bei den Industrieanwendungen sowie der optimalen Entwicklungskapazität kann den Kundenansprüchen mit kontinuierlicher Innovation und einem kompletten Service-Angebot entsprochen werden.

Comer Industries est le leader mondial dans la conception et la production de systèmes d'ingénierie de pointe et des solutions mécatroniques pour la transmission de puissance, fournis aux principaux fabricants pour les applications sur les machines agricoles, les engins de chantier, dans l'industrie et l'énergie renouvelable à travers le monde.

L'Unité Opérative Planetary Drives & Axles s'occupe de la conception, de production et de la commercialisation de réducteurs épicycloïdaux modulaires, de réducteurs de roue et de réducteurs de rotation destinés à une utilisation sur des machines mobiles ou sur des installations fixes industrielles, ponts rigides, directionnels et moteurs.

Les transmissions Planetary Drives sont hautement personnalisables et la connaissance étendue des applications industrielles alliée à de hautes capacités de conception permettent de répondre aux exigences des clients à travers de constantes innovations, la qualité et l'offre d'un service complet.

Comer Industries es líder internacional en el proyecto y la producción de soluciones de mecatrónica para la transmisión de potencia, destinados a los constructores mundiales de máquinas para la agricultura, la industria, la construcción y la energía renovable.

La Unidad Operativa Planetary Drives & Axles de Comer Industries diseña, produce y comercializa reductores epicycloïdales modulares, reductores de rueda y reductores para rotación destinados al empleo en máquinas móviles y en instalaciones industriales fijas, ejes rígidos y direccional.

Las transmisiones Planetary Drives son muy personalizadas y, gracias al gran conocimiento de las aplicaciones industriales junto con la elevada capacidad de diseño, Comer Industries puede satisfacer las exigencias del Cliente a través de la innovación continua, la calidad y brindando un servicio completo.

Comer Industries é líder internacional na concepção e produção de soluções de mecatrônica para a transmissão de potência, destinados aos principais construtores mundiais de máquinas para a agricultura, a indústria, a construção civil e a produção de energia renovável.

Dentro da Comer Industries, a Unidade Operativa Planetary Drives & Axles é a dedicada ao projeto, produgáo e kommercializagáo de redutores planetários modulares, redutores de roda e redu-tores para rotagáo destinados ao em-prego em máquinas operatrices móve-is e em equipamentos industriais fixos, eixos rígidos e direcção.

As transmissões Planetary Drives são altamente personalizadas e o amplo conhecimento das aplicaçoes industriais, aliado á elevada capacidade de projeto, permitem responder ás exigencias do cliente com a inovagao continua, a qualidade e a oferta de um servigo completo.

L'utilizzo del riduttore epicicloidale per la trasmissione di potenza è una risposta moderna alle esigenze di ingombri limitati, di semplicità costruttiva e di affidabilità per l'utilizzatore.

I riduttori epicicloidali PG/PGA sono costituiti da acciaio per il 60% e ghisa per il 35% circa e in percentuale minore da alluminio, rame, gomma e ottone. Tali percentuali variano a seconda delle configurazioni del prodotto.

La famiglia di riduttori epicicloidali PG è offerta al mercato in 23 grandezze di base, selezionate in funzione dei momenti torcenti che possono essere trasmessi all'albero di uscita, che vanno da 0.5 kNm fino a 95 kNm.

La modularità del prodotto Planetary Drives permette l'accoppiamento ai riduttori epicicloidali di coppie coniche, riduttori vite senza fine, freni idraulici, diversi tipi di alberi di ingresso, nonché di flange per l'accoppiamento diretto a motori idraulici o elettrici.

Un altro grande vantaggio derivante dalla modularità dei riduttori epicicloidali è la possibilità del montaggio in serie di stadi di differenti grandezze, in modo da ottenere una vastissima gamma di rapporti di riduzione. La gamma di prodotti Planetary Drives offre rapporti di riduzione da 3.43:1 a 8.67:1 per i riduttori a singolo stadio fino a 8900:1 e oltre per i riduttori a 5 stadi di riduzione.

Le diverse opzioni di albero e flangiatura in uscita semplificano l'installazione del riduttore su applicazioni mobili e impianti fissi industriali.

La fornitura standard del prodotto non prevede la verniciatura a finire. Comer Industries raccomanda l'utilizzo di vernici a basso impatto ambientale.

The use of planetary gear units in the field of power transmission is the modern answer to the demand for compactness, constructive simplicity and product reliability.

PG/PGA planetary drives are made of 60% steel, about 35% cast iron and a lower percentage of aluminium, copper, rubber and brass. These percentages vary depending on the product configurations.

PG planetary gear units are divided into 23 basic groups depending on the different torques that are to be transmitted to the output shaft, which can vary from 0.5 to 95 kNm.

In fact, the Planetary Drives product modular construction permits the coupling of bevel gears, worm gears, hydraulic brakes and a variety of input shafts to the planetary units, as well as providing for a wide choice of coupling flanges for hydraulic or electric motors.

Another advantage of the planetary drives' modular construction is that various stages, in different sizes, can be mounted in series to offer a wide range of reduction ratios. Planetary Drive reduction ratios range from 3.43:1 to 8.67:1 on single-stage drives up to 8900:1 and more on 5-stage drives.

The wide selection of output shafts and flanges simplifies the reduction unit mounting operation on industrial machinery or plants.

Standard supply of the product does not include painting upon completion. Comer Industries recommends using eco-friendly paints.

Im Vergleich zum Stirnradgetriebe, bei dem nur ein Zahn die Kräfte überträgt, wird das Moment am Zentralrad des Planetengetriebes auf drei Zahneingriffe aufgeteilt. Diese Konstruktion führt zu kleinen Getriebeabmessungen, kompakter Bauweise und einem geringen Eigengewicht.

Die Planetengetriebe PG/PGA bestehen zu 60% aus Stahl, zu ca. 35% aus Gusseisen und aus geringeren Mengen Aluminium, Kupfer, Gummi und Messing. Diese prozentuellen Anteile variieren je nach Konfiguration des Produkts.

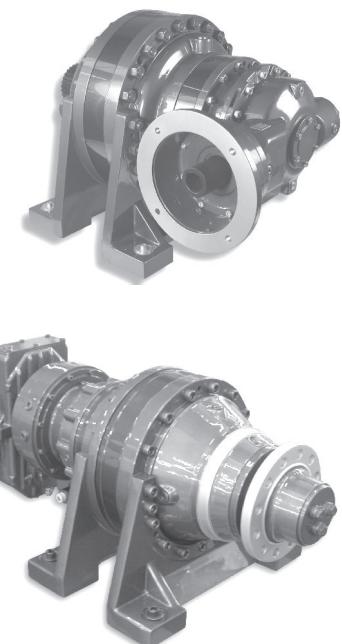

Die Planetengetriebe der Serie PG werden in 23 Grundgrößen mit Abtriebsdrehmomenten von 0.5 kNm bis zu 95 kNm hergestellt.

Die modulare Konstruktion der Planetary Drives-Produkte erlaubt die Kombination mit Kegelradgetrieben, Schneckengetrieben, hydraulischen Bremsen, unterschiedlichen Ausführungen von Antriebswellen und Motorflanschen für hydraulische und elektrische Motoren.

Ein weiterer Vorteil der modularen Bauweise der Getriebe besteht darin, dass viele Stufen in verschiedenen Größen so miteinander kombiniert werden können, dass eine große Bandbreite an Gesamtuntersetzungen angeboten werden kann. Die Untersetzung reichen von 3.43:1 bis 8.67:1 bei einstufigen Getrieben bis hin zu 8900:1 oder mehr bei fünfstufigen Getrieben.

Die verfügbaren Formen hinsichtlich der Wellen und Flansche des Abtriebs erlauben den Einbau der Getriebe in diversen mobilen und stationären Applikationen.

Die Standardausführung des Produkts wird ohne Schlussanstrich geliefert. Comer Industries empfiehlt den Gebrauch von umweltfreundlichen Lacken.

L'utilisation du réducteur planétaire pour la transmission de puissance est une solution moderne répondant aux exigences de dimensions réduites, de simplicité dans la construction et de fiabilité pour l'utilisateur.

Les réducteurs épicycloïdaux PG/PGA sont réalisés à 60% en acier et à 35% environ en fonte, avec un pourcentage minime d'aluminium, de cuivre, de laiton et de caoutchouc. Ces pourcentages varient selon les différentes configurations du produit.

La famille de réducteurs planétaires PG se présente sur le marché avec 23 types de base, sélectionnés en fonction des couples transmissibles sur l'arbre de sortie qui vont de 0.5 à 95 kNm.

La construction modulaire du produit Planetary Drives permet d'accoupler les réducteurs planétaires avec des couples coniques, des vis sans fin, des freins hydrauliques ou bien avec divers types d'arbres d'entrée, ainsi qu'avec des brides pour la fixation directe sur moteurs hydrauliques ou électriques.

La possibilité de monter en série des étages de différents rapports permettant d'obtenir une très vaste gamme de rapports de réduction (de 3.43:1 à 8.67:1 pour les réducteurs monoétages et jusqu'à 8900:1 et plus pour les réducteurs à 5 étages de réduction) est un autre grand avantage résultant de la conception modulaire des réducteurs Planetray Drives.

La possibilité de disposer de plusieurs options en ce qui concerne l'arbre et le bridage côté sortie du réducteur simplifie le montage de ce dernier sur les machines ou sur les équipements industriels.

La fourniture standard du produit ne prévoit pas la peinture de finition. Comer Industries recommande l'utilisation de peintures à faible impact environnemental.

La utilización del reductor epicicloidal para la trasmisión de potencia es una solución moderna ante las exigencias de espacios limitados, de sencillez constructiva y de confiabilidad para el utilizador.

Los reductores epiciclooidales PG/PGA están constituidos por un 60% de acero, aproximadamente, un 35% de fundición y, en menor porcentaje, por aluminio, cobre, caucho y latón. Estos porcentajes varían según las configuraciones del producto.

La familia de reductores epiciclooidales PG está compuesta por 23 grupos básicos, seleccionados en función de los momentos de torsión que se pueden transmitir al eje de salida, que van desde 0.5 kNm hasta 95 kNm.

La construcción modular del producto Planetary Drives permite acoplar a los reductores epiciclooidales de pares cónicos, reductores de tornillo sin fin, frenos hidráulicos, distintos tipos de ejes de entrada, así comobridas para el acoplamiento directo a motores hidráulicos o eléctricos.

Otra gran ventaja ofrecida por la construcción modular de los reductores epiciclooidales es la posibilidad del montaje en serie de etapas con diferente magnitud, para poder obtener una vasta gama de relaciones de reducción.

La gama de productos Planetary Drives ofrece relaciones de reducción de 3.43:1 a 8.67:1 para los reductores con una sola etapa hasta 8900:1 y más para los reductores con 5 etapas de reducción.

Las distintas opciones de eje y de embriddado en la salida simplifican la instalación del reductor en aplicaciones móviles y en instalaciones industriales fijas.

El suministro estándar del producto no prevé la pintura de terminación. Comer Industries recomienda usar pinturas de bajo impacto ambiental.

A utilização de redutores planetários para a transmissão de potência é uma resposta moderna às exigências de compactade, simplicidade de construção e confiabilidade para o usuário final.

Os redutores planetários PG/PGA estão constituídos de 60% de aço, aproximadamente, 35% de ferro fundido e em menor percentagem, por alumínio, cobre, borracha e latão. Estes percentuais variam de acordo às configurações do produto.

A família de redutores planetários PG é oferecida ao mercado em 23 tamanhos básicos, selecionados em função dos momentos de torção que podem ser transmitidos ao eixo de saída, que vão de 0,5 kNm a 95 kNm.

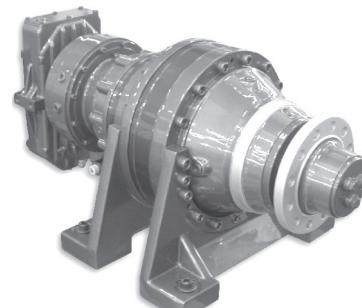

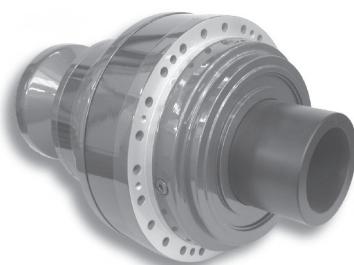

A modularidade do produto Planetary Drives permite o acoplamento a redutores planetários de pares cónicos, redutores de rosca sem fim, freios hidráulicos, vários tipos de eixos de entrada, assim como a seleção de flanges para o acoplamento direto a motores hidráulicos ou elétricos.

Uma outra grande vantagem proporcionada pela modularidade dos redutores planetários é a possibilidade da montagem em série de estágios de diferentes tamanhos, permitindo a obtenção de uma gama extremamente ampla de relações de redução.

A gama de produtos Planetary Drives oferece relações de redução que vão de 3.43:1 a 8.67:1 para redutores de um estágio, até 8900:1 e acima para unidades com 5 estágios de redução.

As diferentes opções de eixos e flanges de saída simplificam a instalação do redutor em aplicações móveis e equipamentos industriais fixos.

O fornecimento padronizado do produto não prevê a pintura de acabamento. Comer Industries recomenda a utilização de pinturas de baixo impacto ambiental.

Dai primi impieghi limitati soprattutto alle macchine movimento terra, Comer Industries ha esteso ed evoluto le possibilità applicative nel settore industriale. Sempre più frequenti sono le applicazioni in impianti chimici, macchine utensili, macchine lavorazione marmo, sistemi di trasporto e sollevamento, impianti alimentari ed ecologici e macchine mobili in generale.

From when the first applications were implemented, limited mainly to earth-moving machinery, Comer Industries has extended and fully developed other applications in the industrial sector. The range of applications has now been extended to a wide variety of mobile machinery, chemical plants, machine tools, marble processing machinery, transportation and hoisting systems, in addition to the food and ecology industries.

Seit den ersten Anwendungen, die sich hauptsächlich auf Erdbewegungsamschinen beschränkten, hat Comer Industries die Anwendungsmöglichkeiten in ständig erweitert. Immer öfter werden die Planetengetriebe auch in industriellen Anwendungen, wie Förder- und Hubsystemen, Krananlagen, im Schiffsbau, in der Offshore-Technik, Stahlverarbeitung, Anlagen der Chemie, im Bereich alternativer Energien, Umwelttechnik und der Nahrungsmitteltechnologie eingesetzt, um nur einige Schwerpunkte aufzuzeigen.

Depuis les premières applications qui se limitaient principalement aux engins des travaux publics, Comer Industries a étendu et développé les possibilités d'emploi dans le domaine industriel.

Les applications sont maintenant de plus en plus fréquentes dans les complexes chimiques, alimentaires et écologiques ainsi que sur les machines outils, les machines pour le travail du marbre, les dispositifs de transport et de relevage et toutes les machines mobiles en général.

A partir de las primeras utilizaciones, limitadas sobre todo a las máquinas para el movimiento de tierra, Comer Industries amplió y desarrolló las posibilidades de aplicación en el sector industrial. Son cada vez más frecuentes las aplicaciones en las instalaciones químicas, máquinas herramientas, máquinas para la elaboración del mármol, sistemas de transporte y elevación, instalaciones alimenticias y ecológicas y máquinas móviles en general.

A partir das primeiras aplicações limitadas principalmente às máquinas de terraplanagem, a Comer Industries estendeu e evoluiu as possibilidades de aplicação no setor industrial. São cada vez mais freqüentes as aplicações em plantas químicas, máquinas operatrizes, máquinas de processamento de mármore, sistemas de transporte e elevação, equipamentos nos setores alimentar e ecológico e máquinas móveis em geral.

IT	CARATTERISTICHE TECNICHE	EN	TECHNICAL INFORMATION	DE	TECHNISCHE EIGENSCHAFTEN
	<b>CARATTERISTICHE TECNICHE</b>		<b>TECHNICAL INFORMATION</b>		<b>TECHNISCHE EIGENSCHAFTEN</b>
	<p>La conoscenza e l'esatta interpretazione dei dati riportati sul presente catalogo sono condizione indispensabile per la scelta e l'impiego corretto dei prodotti presentati.</p> <p>È importante quindi definire alcuni parametri caratteristici:</p> <p><b>RAPPORTO DI TRASMISSIONE i</b></p> <p>È il valore effettivo del rapporto tra la velocità di entrata <math>n_1</math> e la velocità di uscita <math>n_2</math>. Viene indicato per ogni tipo di riduttore nella relativa scheda tecnica.</p> <p><b>VELOCITÀ MASSIMA IN ENTRATA</b>  <math>n_{1\max}</math> [min<sup>-1</sup>]</p> <p>Rappresenta il valore massimo accettabile per ogni grandezza di riduttore, in condizioni di funzionamento intermittente. Per applicazioni in servizio continuo o per velocità superiori a quelle indicate, il Servizio Tecnico Commerciale Comer Industries è a disposizione per ulteriori chiarimenti. I valori della velocità massima in entrata per ogni tipo di riduttore sono illustrati nelle singole schede tecniche.</p> <p><b>RENDIMENTO</b></p> <p>Nella trasmissione epicicloidale, il rendimento è generalmente elevato, mediamente 0.97- 0.98 per ogni stadio di riduzione. Questo dato indicativo si riduce nel caso di funzionamenti a velocità elevate o nel caso di riduttori in versione angolare.</p> <p><b>COPPIA CONTINUA</b>  <math>Mc</math> [kNm]</p> <p>È quella coppia per cui il valore delle sollecitazioni sugli ingranaggi è pari al valore limite secondo le norme internazionali ISO 6336.</p> <p>Questo valore convenzionale corrisponde ad una durata di vita teorica illimitata degli ingranaggi, tenendo conto sia della sollecitazione a flessione che della resistenza superficiale del dente (pressione di Hertz).</p>	<p>To properly select and implement our products, users must have complete knowledge of and correctly interpret the information provided in this catalogue.</p> <p>Thus, it's important to define some distinctive parameters, such as:</p> <p><b>REDUCTION RATIO i</b></p> <p>This is the ratio between input speed <math>n_1</math> and output speed <math>n_2</math>. It is provided for each drive shown on the relative technical sheet.</p> <p><b>MAXIMUM INPUT SPEED</b>  <math>n_{1\max}</math> [min<sup>-1</sup>]</p> <p>This is the maximum allowable speed for each size of drive under intermittent work conditions. For more information about continuous duty or higher speeds, please contact the Comer Industries Technical-Commercial Service Department. Maximum speed values for each type of planetary drive are illustrated on the single technical sheets.</p> <p><b>EFFICIENCY</b></p> <p>Efficiency is usually high in planetary transmissions: average values range between 0.97 and 0.98 for each reduction stage. This approximate value decreases under high-speed conditions or in applications with bevel gears.</p> <p><b>CONTINUOUS TORQUE</b>  <math>Mc</math> [kNm]</p> <p>Continuous torque is the maximum value of the stress on the gears according to international standard ISO 6336.</p> <p>This conventional value corresponds to the unlimited theoretical duration of the gears, taking into account both the bending stress and the surface strength of the tooth (Hertz pressure).</p>	<p>Die Kenntnis der Anforderung, sowie die korrekte Umsetzung der im Katalog gelieferten Daten sind Voraussetzung für die gezielte Auswahl und somit den erfolgreichen Einsatz des entsprechenden Produktes.</p> <p>Es ist deshalb wichtig, die folgenden Bestimmungsfaktoren festzulegen:</p> <p><b>ÜBERSETZUNG i</b></p> <p>Es handelt sich um den Quotienten aus Antriebsdrehzahl <math>n_1</math> und Abtriebsdrehzahl <math>n_2</math>. Sie wird für jedes Getriebemodell im jeweiligen technischen Datenblatt angegeben.</p> <p><b>MAXIMAL ZULÄSSIGE ANTRIEBSDREHZAHL</b>  <math>n_{1\max}</math> [min<sup>-1</sup>]</p> <p>Ist die zulässige Höchstgeschwindigkeit für jedes Planetengetriebe im intermittierenden Betrieb. Im Dauerbetrieb mit Antriebsdrehzahlen, die die angegebenen Werte überschreiten, halten Sie bitte Rücksprache mit dem Kundenservice (Sales) von Comer Industries. Die Werte der zulässigen Eingangsdrehzahl sind für jedes Getriebemodell im technischen Datenblatt angegeben.</p> <p><b>WIRKUNGSRAD</b></p> <p>Der Wirkungsgrad des Planetengetriebes liegt pro Planetenstufe bei 98%; d.h. bei einem dreistufigem Getriebe <math>n_{\text{gesamt}} = 0,98 \times 0,98 \times 0,98 = 94\%</math>. Dieser Anhaltswert nimmt beim Betrieb mit hohen Geschwindigkeiten sowie bei Getrieben in der Winkelauflösung ab</p> <p><b>DAUERDREHMOMENT</b>  <math>Mc</math> [kNm]</p> <p>Dieser allgemein festgelegte Wert entspricht einer theoretisch unbegrenzten Lebensdauer der Zahnräder, wobei sowohl die Biegespannung als auch die zulässige Hertzische Pressung auf die Zahnflankenoberfläche berücksichtigt werden.</p> <p>Es handelt sich um das Limit der Beanspruchung an die Verzahnung gemäß der Norm ISO 6336</p>		

**CARACTÉRISTIQUES TECHNIQUES**

La connaissance et la bonne interprétation des données contenues dans le présent catalogue sont deux conditions indispensables qui permettent de choisir et d'utiliser correctement les produits présentés.

Il est par conséquent important de définir un certains nombre de paramètres spécifiques:

**RAPPORT DE TRANSMISSION i**

Il s'agit de la valeur effective du rapport entre la vitesse d'entrée  $n_1$  et la vitesse de sortie  $n_2$ .

Elle est indiquée sur la fiche technique de chaque type de réducteurs.

**VITESSE MAXIMALE D'ENTREE**

$n_{1\max} [\text{min}^{-1}]$

Ce paramètre représente la vitesse maximale admise pour chaque taille de réducteur, en condition de fonctionnement intermittent. Pour des applications en service continu ou bien pour des vitesses supérieures à celles indiquées, le Service Technico-Commercial Comer Industries est à votre disposition pour toute information supplémentaire.

Les valeurs de vitesse maximale en entrée sont indiquées sur la fiche technique de chaque type de réducteur.

**RENDEMENT**

Sur les transmissions épicycloïdales, le rendement est généralement élevé, 0.97-0.98 en moyenne pour chaque étage de réduction. Cette donnée indicative peut être inférieure dans le cas d'un fonctionnement à haute vitesse ou dans le cas de réducteurs en version angulaire.

**COUPLE CONTINU**

$M_c [\text{kNm}]$

Il s'agit du couple auquel la valeur des sollicitations sur les engrenages est égale à la valeur limite selon les normes internationales ISO 6336.

Cette valeur conventionnelle correspond à une durée de vie théorique illimitée des engrenages, en tenant compte aussi bien de la contrainte de flexion que de la résistance de la surface de la dent (pression de Hertz).

**CARACTERÍSTICAS TÉCNICAS**

El conocimiento y la correcta interpretación de los datos indicados en este catálogo son una condición indispensable para efectuar la mejor elección y utilización de los productos presentados.

Por tanto es importante definir algunos parámetros característicos:

**RELACIÓN DE TRANSMISIÓN i**

Es el valor efectivo de la relación entre la velocidad de entrada  $n_1$  y la velocidad de salida  $n_2$ .

El valor para cada tipo de reductor se indica en la respectiva ficha técnica.

**VELOCIDAD MÁXIMA DE ENTRADA**

$n_{1\max} [\text{min}^{-1}]$

Representa el valor máximo aceptable para cada dimensión de reductor, con funcionamiento intermitente. Para aplicaciones con servicio continuo o para velocidades superiores a aquellas indicadas, se aconseja ponerse en contacto con el Servicio Técnico-Comercial de Comer Industries.

Los valores de la velocidad máxima de entrada para cada tipo de reductor se indican en las respectivas fichas técnicas.

**RENDIMIENTO**

En la transmisión epicicloidal, el rendimiento es generalmente elevado, entre 0.97-0.98 para cada etapa de reducción. Este dato indicativo se reduce para el funcionamiento con elevadas velocidades o para aplicaciones con reductores cónicos.

**MOMENTO DE TORSIÓN CONTINUO**

$M_c [\text{kNm}]$

Es el valor del momento para el cual el valor de las solicitudes en los engranajes es igual al valor límite según las normas internacionales ISO 6336.

Este valor convencional corresponde a un tiempo de vida teórico ilimitado de los engranajes, teniendo en cuenta la solicitud bajo flexión y la resistencia superficial del diente (presión de Hertz).

**CARACTERÍSTICAS TÉCNICAS**

O conhecimento e a interpretação exata dos dados fornecidos neste catálogo são uma condição indispensável para a seleção e o emprego correto dos produtos apresentados

É assim extremamente importante definir alguns parâmetros característicos:

**RELAÇÃO DE TRANSMISSÃO i**

É o valor efetivo da relação entre a velocidade de entrada  $n_1$  e a velocidade de saída  $n_2$ .

É indicado para cada tipo de reductor na respectiva ficha técnica.

**VELOCIDADE MÁXIMA DE ENTRADA**

$n_{1\max} [\text{min}^{-1}]$

Representa o valor máximo aceitável para cada tamanho de reductor, em condições de funcionamento intermitente. Para aplicações em serviço contínuo ou para velocidades maiores do que as indicadas, o Serviço Técnico Comercial da Comer Industries está à disposição dos clientes para fornecer mais esclarecimentos.

Os valores da velocidade máxima de entrada para cada tipo de reductor são indicados nas respectivas fichas técnicas.

**RENDIMENTO**

Na transmissão epícicloidal, o rendimento é geralmente elevado, em média 0.97-0.98 para cada estágio de redução. Este dado indicativo diminui no caso de funcionamentos com velocidade elevada ou no caso de redutores na versão angular.

**TORQUE CONTÍNUO**

$M_c [\text{kNm}]$

Representa o torque para o qual o valor das solicitações nas engrenagens corresponde ao valor limite segundo as normas internacionais ISO 6336.

Este valor convencional corresponde a uma vida útil teórica ilimitada das engrenagens, considerando tanto a solicitação à flexão, como a resistência superficial do dente (pressão de Hertz).

Ai fini della scelta del riduttore questo valore va posto in riferimento alla COSTANTE DI DURATA  $n_{xh}$  espressa nel Diagramma 1 dove:

$n$  = velocità in uscita ( $\text{min}^{-1}$ )  
 $h$  = durata di funzionamento (ore).

Per semplicità di consultazione, nella scheda tecnica di prodotto sono riportati i valori di  $Mc$  corrispondenti ad un valore  $n_{2xh}$  prefissato.

#### COPPIA MASSIMA

$M_{\max}$  [kNm]

È il valore massimo di coppia che il riduttore può trasmettere per breve tempo senza che si verifichino danneggiamenti ai suoi componenti interni ed alla sua struttura. Tale valore deve essere considerato come una coppia massima dovuta a picchi o spunti di avviamento e mai come coppia di lavoro; il valore  $M_{\max}$  deve inoltre essere opportunamente valutato in quegli azionamenti che comportano un elevato numero di avviamenti o inversioni.

Il valore  $M_{\max}$  è indicato nelle schede tecniche di prodotto.

For the purpose of selecting a drive, this value must be considered in relation to the DURATION CONSTANT  $n_{xh}$ , as shown in Curve 1 where:

$n$  = output speed ( $\text{min}^{-1}$ )  
 $h$  = working time (hours)

To make consultation easier, the  $Mc$  values corresponding to a fixed  $n_{2xh}$  value are shown on the product technical sheets.

Um eine korrekte Auswahl des Getriebes zu treffen, muß dieser Wert in Bezug zur LEBENSDAUER- KONSTANTE  $n_{xh}$  gesetzt werden (Diagramm 1).

$n$  = Drehzahl an der Ausgangswelle ( $\text{min}^{-1}$ )  
 $h$  = Betriebsdauer (Stunden)

Zum einfacheren Nachschlagen sind in dem Datenblatt die einem vorgegebenen Wert von  $n_{xh}$  entsprechenden  $Mc$ -Werte angegeben.

#### MAXIMUM TORQUE

$M_{\max}$  [kNm]

This is the maximum output torque that the drive can transmit over a brief time interval without damaging its internal components and structure. This value must be considered as the maximum output torque owing to working or start-up peaks and never as the continuous working torque.  $M_{\max}$  must also be carefully evaluated in those applications with a high number of start-ups or reversals.

The  $M_{\max}$  value is shown on the single product technical cards.

#### MAXIMALES DREHMOMENT

$M_{\max}$  [kNm]

Es handelt sich um den maximal zulässigen Wert des Drehmoments, den das Getriebe kurzzeitig übertragen kann, ohne daß Schäden auftreten. Dieser Wert ist als maximales Drehmoment bei kurzzeitigen Spitzenbelastungen zu betrachten und niemals als Drehmoment bei Dauerbetrieb; er muß außerdem jeweils entsprechend dem Lastkollektiv gewertet werden.

#### TEMPERATURA DI FUNZIONAMENTO

Le temperature dell'olio a cui i riduttori possono funzionare sono quelle comprese tra -20°C e + 90°C. Temperature al di fuori di questa fascia possono essere accettate se si prevedono particolari accorgimenti relativi ai tipi di lubrificante e di guarnizioni utilizzati. Tali accorgimenti possono essere decisi caso per caso, d'accordo con il Servizio Tecnico-Commerciale Comer Industries.

#### WORKING TEMPERATURE

The working oil temperature of the drives should range between -20°C and +90°C. Temperatures falling outside this range might be tolerated only if special lubricants and gaskets are used. For further information, please contact the Comer Industries Technical-Commercial Service Department.

#### BETRIEBSTEMPERATUR

Die Getriebe können bei einer Umgebungstemperatur zwischen -20°C und + 90°C betrieben werden. Ein Betrieb bei Temperaturen außerhalb dieses Bereiches ist möglich, vorausgesetzt daß besondere Maßnahmen in Bezug auf verwendete Schmierstoffe und Dichtungen beachtet werden. Diese Maßnahmen können im Einzelfall in Abstimmung mit dem Kundenservice (Sales) von Comer Industries entschieden werden.

#### POTENZA TERMICA

$P_t$  [kW]

È la potenza massima trasmissibile dal riduttore in funzionamento continuo con lubrificazione normale a sbattimento, senza che l'olio superi la temperatura di 90°C. I valori di  $P_t$  riportati nelle singole schede tecniche di prodotto sono valori massimi espressi alle seguenti condizioni di impiego:

- servizio continuo
- velocità  $n_1 = 1500 \text{ min}^{-1}$

#### THERMAL POWER

$P_t$  [kW]

The thermal power is the maximum power the drive can transmit under continuous duty with normal turbulence lubrication and without exceeding an oil temperature of 90°C.

The  $P_t$  values shown on the single product technical sheet indicate the maximum values under the following duty conditions:

- continuous duty
- speed  $n_1 = 1500 \text{ min}^{-1}$

#### THERMISCHE LEISTUNG

$P_t$  [kW]

Es handelt sich um die maximale Leistung, die das Getriebe bei Dauerbetrieb und normaler Schmierweise übertragen kann, ohne daß die Öltemperatur von 90°C überschritten wird.

Die in den jeweiligen technischen Datenblättern aufgeführten  $P_t$ -Werten sind Maximalwerte unter den folgenden Betriebsbedingungen:

- Dauerbetrieb ohne Unterbrechungen
- Drehzahl  $n_1 = 1500 \text{ min}^{-1}$

CARACTERISTIQUES TECHNIQUES	FR	CARACTERÍSTICAS TÉCNICAS	ES	CARACTERÍSTICAS TÉCNICAS	PT
--------------------------------	----	-----------------------------	----	-----------------------------	----

Pour le choix du réducteur, cette valeur doit être mise en rapport avec CONSTANTE DE DURÉE nxh indiquée dans le Diagramme 1 où:

n = vitesse de sortie ( $\text{min}^{-1}$ )

h = durée de fonctionnement (heures)

Pour simplifier la consultation, les fiches techniques des produits indiquent les valeurs de Mc correspondant à une valeur  $n_2xh$  prédéterminée.

#### COUPLE MAXIMAL

$M_{\max}$  [kNm]

Il s'agit de la valeur maximum de couple que le réducteur peut transmettre pendant une courte durée, sans que ni ses composants internes ni sa structure ne subissent de dommages. Cette valeur doit être considérée comme un couple maximum lors de pics ou lors de mises en marche et ne doit jamais être envisagée comme couple de fonctionnement. La valeur  $M_{\max}$  doit en outre être bien évaluée sur les actionnements qui prévoient un grand nombre de mises en marche ou d'inversions.

La valeur  $M_{\max}$  est indiquée sur chaque fiche technique de produit.

#### TEMPERATURE DE FONCTIONNEMENT

Les températures de l'huile auxquelles les réducteurs peuvent fonctionner sont celles comprises entre -20°C et + 90°C. Des températures hors de cette plage sont acceptables à condition de prendre des précautions spécifiques concernant le type de lubrifiant et les joints utilisés.

Ces précautions sont à établir au cas par cas, en accord avec le Service Technico-Commercial Comer Industries.

#### PUISANCE THERMIQUE

$P_t$  [kW]

Il s'agit de la puissance maximale transmissible par le réducteur en fonctionnement continu en conditions de lubrification standard par barbotage, sans que l'huile ne dépasse la température de 90°C.

Les valeurs de  $P_t$  indiquées sur chaque fiche technique sont des valeurs maximales établies dans les conditions d'utilisation suivantes:

- service continu
- vitesse  $n_1 = 1500 \text{ min}^{-1}$

Para la elección del reductor, este valor representa la CONSTANTE DEL TIEMPO DE VIDA nxh como se muestra en el Diagrama 1 donde:

n = velocidad en la salida ( $\text{min}^{-1}$ )

h = duración de funcionamiento (horas).

Para simplificar la consulta, en la ficha técnica del producto se indican los valores de Mc correspondientes a un valor  $n_2xh$  prefijado.

#### MÁXIMO MOMENTO DE TORSIÓN

$M_{\max}$  [kNm]

Es el máximo valor del momento de torsión que el reductor puede transmitir durante un tiempo breve sin que se produzcan daños en sus componentes internos y estructura. Dicho valor se tiene que considerar como el máximo momento de torsión debido al trabajo o a picos de arranque y jamás como un momento continuo de trabajo. Además, el valor  $M_{\max}$  se tendrá que evaluar en aquellos accionamientos que requieran un gran número de arranques o inversiones.

El valor  $M_{\max}$  se indica en las fichas técnicas del producto.

#### TEMPERATURA DE FUNCIONAMIENTO

Las temperaturas del aceite para las cuales los reductores pueden funcionar tienen que estar comprendidas entre -20°C y + 90°C. Se pueden aceptar temperaturas fuera de esta faixa si se prevén particulares precauciones respecto a los tipos de lubricante y de guarniciones utilizadas. Dichas precauciones se pueden establecer según el caso, poniéndose de acuerdo con el Servicio Técnico-Comercial de Comer Industries.

#### POTENCIA TÉRMICA

$P_t$  [kW]

Es la potencia máxima que puede transmitir el reductor durante el funcionamiento continuo con lubricación normal por circulación y salpicadura y sin que el aceite supere los 90°C.

Los valores de  $P_t$  indicados en cada una de las fichas técnicas del producto son los máximos valores para las siguientes condiciones de utilización:

- servicio continuo
- velocidad  $n_1 = 1500 \text{ min}^{-1}$

Para escolher o redutor, este valor deve ser relacionado com a CONSTANTE DE DURAÇÃO nxh expressa no Diagrama 1, onde:

n = velocidade de saída ( $\text{min}^{-1}$ )

h = duração de funcionamento (horas).

Para simplificar a consulta, na ficha técnica do produto são indicados os valores de Mc correspondentes a um valor  $n_2xh$  prefixado.

#### TORQUE MÁXIMO

$M_{\max}$  [kNm]

É o valor máximo de torque que o redutor pode transmitir durante um breve intervalo de tempo sem que ocorram danos nos seus componentes internos e na sua estrutura. Este valor deve ser considerado como um torque máximo decorrente de picos de funcionamento ou de arranque e nunca como torque de trabalho; além disso, o valor  $M_{\max}$  deve ser cuidadosamente avaliado nos acionamentos que exigem um número elevado de arranques ou de inversões.

O valor  $M_{\max}$  é indicado nas fichas técnicas do produto.

#### TEMPERATURA DE FUNCIONAMENTO

As temperaturas do óleo com as quais os redutores podem funcionar vão de -20°C a + 90°C. Valores de temperatura fora desta faixa só podem ser admitidas se forem empregadas precauções especiais para o que se refere aos óleos e às guarnições. Estas precauções podem ser decididas caso a caso, consultando o Serviço Técnico Comercial da Comer Industries.

#### POTÊNCIA TÉRMICA

É a potência máxima que pode ser transmitida pelo redutor em funcionamento contínuo com lubrificação normal por chapinhagem, sem que a temperatura do óleo ultrapasse 90°C.

Os valores de  $P_t$  indicados nas fichas técnicas de produto representam valores máximos expressos nas seguintes condições de emprego:

- serviço contínuo
- velocidade  $n_1 = 1500 \text{ min}^{-1}$

- olio ISO VG 150
- posizione di montaggio orizzontale
- temperatura ambiente 20°C.

- oil ISO VG 150
- horizontal mounting position
- Room temperature 20°C.

- ÖL ISO VG 150
- waagerechte Einbaulage
- Umgebungstemperatur +20°C

Qualora la potenza richiesta ecceda i valori indicati nella scheda tecnica del riduttore sarà necessario prevedere un sistema di raffreddamento del lubrificante.

Per i riduttori con piedi (dalla grandezza PG 100 alla grandezza PG 1600) il valore di Pt può essere incrementato del 15%.

Nel caso le caratteristiche di impiego siano diverse, si può applicare ai valori di Pt un fattore correttivo fk, come indica la Tabella 1, di seguito riportata:

If the required power exceeds the values indicated on the drive technical sheet, a lubricant cooling system must be installed.

For foot-mounted drives (from the PG 100 to the PG 1600 series), the Pt value can be increased by 15%.

If the duty characteristics differ, you can apply a corrective factor fk to the Pt values as indicated in Table 1 below:

Sollte die geforderte Leistung die im technischen Datenblatt des Getriebes aufgeführten Werte übersteigen, wird ein Schmiermittel-Kühlsystem erforderlich.

Der Pt- Wert der Getriebe in Fussaussfuehrung (von Größe PG 100 bis PG 1600) kann um 15% erhöht werden.

Weichen die Einsatzbedingungen von den Normbedingungen ab, können die Pt-Werte durch den Korrekturfaktor fk korrigiert werden (vgl. nachstehend aufgeführte Tabelle 1):

$$Pt_1 = Pt \times fk$$

Fattore di adeguamento della capacità termica fk Thermal power adjustment factor fk Anpassungsfaktor Wärmekapazität fk					
Tempo % di funzionamento Work time % Betriebszeit in %	Temperatura ambiente °C / Room temperature °C / Raumtemperatur In °C				
	10°	20°	30°	40°	50°
100	1.1	1.0	0.8	0.7	0.6
80	1.2	1.1	1.0	0.8	0.7
60	1.4	1.2	1.1	1.0	0.8
40	1.6	1.4	1.2	1.1	1.0
20	1.8	1.6	1.4	1.2	1.1

Tabella 1 / Table 1 / Tabelle 1

**N.B.** Si noti che la Pt è riferita alla potenza effettivamente trasmessa dal riduttore, da non confondere quindi con la potenza del motore su di esso installato, che per vari motivi potrebbe essere superiore.

Per ulteriori dettagli si prega di contattare il Servizio Tecnico-Commerciale Comer Industries.

**NOTE.** Pt refers to the power actually transmitted by the drive. It should not be confused with the power of the motor mounted on the drive which, for various reasons, might be higher.

For further details please contact the Comer Industries Technical-Commercial Service Department.

**ANMERKUNG:** Es wird darauf hingewiesen, daß sich der Pt- Wert auf die tatsächlich vom Getriebe übertragene Leistung bezieht; sie darf nicht mit der Leistung des eingebauten Motors verwechselt werden, die höher sein könnte.

Für weitere Rückfragen wenden Sie sich bitte an den Kundenservice (Sales) von Comer Industries.

## FATTORE DI SERVIZIO fs

È un coefficiente di moltiplicazione che viene inserito nella formula per la scelta del riduttore.

Serve per tener conto delle condizioni di carico dell'applicazione, ed è definito dalla Tabella 2

## SERVICE FACTOR fs

Service factor fs is a multiplication coefficient introduced into the formula for selecting the drive.

This factor takes into account the application load conditions.  
It is defined in Table 2.

## BETRIEBSFAKTOR fs

Es handelt sich um einen Multiplikationskoeffizienten, der in die Formel eingesetzt wird.

Damit soll den nach Einsatzform unterschiedlichen Belastungen Rechnung getragen werden; er wird in Tabelle 2 aufgeführt.

CARACTÉRISTIQUES TECHNIQUES	FR	CARACTERÍSTICAS TÉCNICAS	ES	CARACTERÍSTICAS TÉCNICAS	PT
--------------------------------	----	-----------------------------	----	-----------------------------	----

- huile ISO VG 150
- position de montage horizontale
- température ambiante 20°C.

Si la puissance requise dépasse les valeurs indiquées sur la fiche technique du réducteur, il est nécessaire de prévoir l'installation d'un système de refroidissement du lubrifiant

Pour les réducteurs à pattes, (de la grandeur PG 100 à la grandeur PG 1600) la valeur Pt peut être majorée de 15%.

Dans le cas où les caractéristiques d'utilisation seraient différentes, il est possible d'appliquer un facteur correctif fk, comme indiqué dans le Tableau 1 ci-dessous:

- aceite ISO VG 150
- posición de montaje horizontal
- temperatura ambiente 20°C.

Si la potencia requerida excede los valores indicados en la ficha técnica del reductor será necesario prever un sistema de enfriamiento del lubricante.

Para los reductores con pie (desde la serie PG 100 hasta PG 1600) el valor de Pt se puede incrementar el 15%.

Si las características de empleo son distintas, a los valores de Pt se les puede aplicar un factor de corrección fk, como se indica en la siguiente Tabla 1:

- óleo ISO VG 150
- posição de montagem horizontal
- temperatura ambiente de 20°C.

Se a potência requerida ultrapassar os valores indicados na ficha técnica do redutor, será necessário instalar um sistema de resfriamento do lubrificante.

Para os redutores com pés (do tamanho PG 100 ao tamanho PG 1600), o valor de Pt pode ser aumentado em 15%.

Se as características de emprego forem diferentes, pode-se aplicar aos valores de Pt um fator de correção fk, conforme indicado na Tabela 1 reproduzida a seguir:

$$Pt_1 = Pt \times fk$$

Facteur d'adaptation de la capacité thermique fk Factor de adaptación de la capacidad térmica fk Fator de adaptação da capacidade térmica fk					
Temps % de fonctionnement Tiempo % de funcionamiento Tempo % de funcionamento	Température Ambiante °C / Temperatura ambiente °C / Temperatura ambiente °C				
	10°	20°	30°	40°	50°
100	1.1	1.0	0.8	0.7	0.6
80	1.2	1.1	1.0	0.8	0.7
60	1.4	1.2	1.1	1.0	0.8
40	1.6	1.4	1.2	1.1	1.0
20	1.8	1.6	1.4	1.2	1.1

Tableau 1 / Tabla 1 / Tabela 1

**N.B.** Pt se réfère à la puissance effectivement transmise par le réducteur; il est important de ne pas confondre cette valeur avec la puissance du moteur sur lequel le réducteur est installé, puissance qui, pour différentes raisons, peut être supérieure.

Pour plus de détails, s'adresser au Service Technico-Commercial Comer Industries.

**Nota:** tener en cuenta que la Pt se refiere a la potencia efectivamente transmitida por el reductor, por tanto no hay que confundirse con la potencia del motor instalado sobre el mismo, que por distintos motivos podría ser superior.

Para más detalles se aconseja ponerse en contacto con el Servicio Técnico-Comercial de Comer Industries.

**OBS.:** é importante ressaltar que a Pt refere-se à potência efetivamente transmitida pelo redutor, não devendo ser confundida com a potência do motor instalado nele que, por vários motivos, pode ser superior.

Para maiores informações, entre em contato com o Serviço Técnico Comercial da Comer Industries.

#### FACTEUR DE SERVICE fs

Il s'agit d'un coefficient de multiplication qui est introduit dans la formule servant à choisir le réducteur.

Il permet de tenir compte des conditions de charge de l'application et est défini dans le Tableau 2.

#### FACTOR DE SERVICIO fs

Es un coeficiente de multiplicación que se introduce en la fórmula para la elección del reductor.

Sirve para tener en cuenta las condiciones de carga de la aplicación y está definido en la Tabla 2.

#### FATOR DE SERVIÇO fs

É um coeficiente de multiplicação que é introduzido na fórmula para a escolha do redutor.

Serve para considerar as condições de carga da aplicação, sendo definido pela Tabela 2.

**CARICHI SULL'ALBERO DI USCITA E  
ENTRATA Fr ; Fa [N]**

Fr = carico radiale  
Fa = carico assiale

I valori dei carichi applicabili sugli alberi di uscita si ricavano dai diagrammi riportati in corrispondenza di ogni grandezza di riduttore, mentre quelli relativi agli alberi di entrata si trovano a pag. D-4.

I carichi radiali ed assiali massimi non possono agire contemporaneamente.

L'entità dei carichi ammessi Fr , Fa è riferita ad una durata dei cuscinetti secondo ISO 281, corrispondente a:

$n \times h = 10^5$  per alberi di uscita

$n \times h = 5 \times 10^6$  per alberi in entrata

I riduttori in versione F vengono normalmente utilizzati per trasmettere coppia senza carichi radiali, pertanto non vengono indicate le capacità di Fr ed Fa massime.

Per informazioni ulteriori contattare il Servizio Tecnico-Commerciale Comer Industries.

**OUTPUT AND INPUT SHAFT LOADS  
Fr ; Fa [N]**

Fr = radial load  
Fa = axial load

The load values that output shafts can bear are indicated on the load curves shown for each drive size; the load values relevant to input shafts are shown on page D-4.

Maximum radial and axial loads must not occur simultaneously.

The values of the tolerated loads Fr, Fa refer to a bearing duration, according to standard ISO 281, corresponding to:

$n \times h = 10^5$  for output shafts

$n \times h = 5 \times 10^6$  for input shafts

**BELASTUNG DER ABTRIEBSWELLE  
UND ANTRIEBSWELLE Fr ; Fa [N]**

Fr = Radiallast  
Fa = Axiallast

Die Belastbarkeit der Abtriebswelle ergibt sich aus den jeder Getriebegröße zugeordneten Diagrammen. Dagegen sind die Werte der Antriebswelle auf der S. D-4 ersichtlich.

Die zulässigen Maximalwerte der Radial- und Axialbelastungen dürfen nicht gleichzeitig auftreten.

Der Wert der zulässigen Belastung durch Fr und Fa bezieht sich auf eine Betriebsdauer nach ISO 281, das entspricht:

$n \times h = 10^5$  fuer Abtriebswelle

$n \times h = 5 \times 10^6$  fuer Antriebswelle

Nell'ambito del continuo sviluppo e miglioramento del prodotto, la Comer Industries si riserva la facoltà di apportare le modifiche sia tecniche sia dimensionali che saranno ritenute opportune, senza darne espresso preavviso.

Because Comer Industries is continuously improving its product, it will make the technical and dimensional changes deemed necessary, without notifying the market in advance.

Im Rahmen der ständigen Weiterentwicklung und Verbesserung der Produkte behält sich Comer Industries das Recht vor, erforderliche technische Änderungen ohne ausdrückliche Vorankündigung durchzuführen.

**SCELTA DEL RIDUTTORE**

In una trasmissione meccanica, il riduttore è un organo inserito tra motore ed utenza. Le sollecitazioni a cui è sottoposto durante il funzionamento sono funzione delle curve caratteristiche del motore come di quelle dell'utenza (assorbimento e ciclo di lavoro).

La conoscenza della trasmissione nella sua interezza è condizione necessaria per la corretta scelta del riduttore.

È necessario conoscere:

**UTENZA**

- a) tipo di servizio
- b) velocità di rotazione
- c) potenza e/o coppia assortita
- d) ciclo di lavoro

**MOTORE**

- e) tipo e caratteristiche del motore
- f) potenza e/o coppia erogata
- g) velocità di funzionamento

**DRIVE SELECTION**

In a mechanical transmission system, a drive is a device positioned between the prime mover and the driven equipment. The stress it is subjected to during operation is strictly related to the characteristics of the prime mover and the driven equipment (power absorption and work cycle).

Knowledge of the entire transmission system is mandatory to choose the best drive.

It is necessary to know the following:

**DRIVEN EQUIPMENT**

- a) type of operation
- b) rotation speed
- c) power and/or torque absorption
- d) working cycle

**PRIME MOVER**

- e) type and characteristics of the prime mover
- f) delivered power and/or torque
- g) operating speed

**GETRIEBEAUSWAHL**

In einem mechanischen System ist das Getriebe eine Einheit zwischen Motor und anzutreibender Maschine. Die Belastungen die auf dem Getriebe während des Betriebes wirken, sind eine Funktion sowohl der Motor-als auch der Maschinenkennlinie (Leistungsaufnahme und Lastkollektiv).

Die Kenntnis des gesamten Antriebssystems ist Voraussetzung für die korrekte Auswahl des Getriebes. Man sollte folgende Daten berücksichtigen:

**ANZUTREIBENDE MASCHINE**

- a) Einsatz
- b) Drehgeschwindigkeit
- c) Leistung und/oder
- d) Lastkollektiv

**MOTOR**

- e) Typ und Eigenschaften des Motors
- f) Leistung und/oder Drehmoment
- g) Drehgeschwindigkeit

## CARACTÉRISTIQUES TECHNIQUES

**FR**

## CARACTERÍSTICAS TÉCNICAS

**ES**

## CARACTERÍSTICAS TÉCNICAS

**PT**

### CHARGES SUR L'ARBRE DE SORTIE ET D'ENTREE Fr ; Fa [N]

Fr = charge radiale  
Fa = charge axiale

Les valeurs des charges applicables sur l'arbre de sortie peuvent être obtenues à partir des diagrammes correspondants à chaque famille de réducteur; celles relatives aux arbres d'entrée sont indiquées page D-4.

Les charges radiales et axiales maximales ne sont pas cumulables.

La valeur des charges admissibles Fr et Fa se réfère à une durée des roulements établie selon la norme ISO 281, à savoir:

$n \times h = 10^5$  pour arbres de sortie

$n \times h = 5 \times 10^6$  pour arbres d'entrée

Les réducteurs version F sont généralement utilisés pour transmettre un couple sans charges radiales, aussi les charges maximales Fr et Fa ne sont-elles pas indiquées.

Pour de plus amples informations, s'adresser au Service Technico-Commercial Comer Industries.

### CARGAS EN EL EJE DE SALIDA Y ENTRADA Fr ; Fa [N]

Fr = carga radial  
Fa = carga axial

Los valores de las cargas aplicables sobre los ejes de salida se obtienen de los diagramas indicados en correspondencia con cada dimensión del reductor, mientras los valores en los ejes de entrada se encuentran en la Pág. D-4.

Las cargas radiales y axiales máximas no pueden intervenir simultáneamente.

El valor de las cargas admitidas Fr , Fa está referido a una duración de los rodamientos según la norma ISO 281y corresponde a:

$n \times h = 105$  para ejes de salida

$n \times h = 5 \times 10^6$  para ejes de entrada

Los reductores de la versión F generalmente se utilizan para transmitir un momento de torsión sin cargas radiales, por tanto no se indican los valores máximos de Fr y Fa.

Para más informaciones, se recomienda ponerse en contacto con el Servicio Técnico-Comercial de Comer Industries.

### CARGAS NO EIXO DE SAÍDA E ENTRADA Fr ; Fa [N]

Fr = carga radial  
Fa = carga axial

Os valores das cargas aplicáveis nos eixos de saída são obtidos a partir dos diagramas correspondentes a cada tamanho de redutor. Já os valores relativos aos eixos de entrada, estão indicados na pág. D-4.

As cargas radiais e axiais máximas não podem atuar simultaneamente.

O valor das cargas admitidas Fr, Fa refere-se a uma duração dos rolamentos segundo ISO 281, correspondente a:

$n \times h = 105$  para os eixos de saída

$n \times h = 5 \times 10^6$  para os eixos de entrada

Os redutores na versão F são utilizados normalmente para transmitir torque sem cargas radiais, não sendo por isso mostradas as capacidades de Fr e Fa máximas.

Para mais informações, entre em contato com o Serviço Técnico Comercial da Comer Industries.

**Comer Industries se réserve le droit d'apporter, sans préavis, les modifications de type technique et dimensionnel jugées nécessaires au développement et à l'amélioration constante de ses produits.**

**Comer Industries continua desarrollando y mejorando sus productos, reservándose la facultad de efectuar las oportunas modificaciones técnicas y dimensionales sin previo aviso.**

**Por estar comprometida com o desenvolvimento e melhoramento contínuos dos seus produtos, a Comer Industries reserva-se o direito de efetuar as modificações técnicas e/ou dimensionais que considerar adequadas sem aviso prévio expresso.**

### SELECTION DU REDUCTEUR

Dans un système de transmission mécanique, le réducteur est un organe situé entre le moteur et la machine à actionner. Les sollicitations auxquelles il est soumis pendant le fonctionnement sont fonction des courbes caractéristiques du moteur ainsi que de celles la machine à actionner (absorption de puissance et cycle de travail). La connaissance du système de transmission dans son intégralité est une condition indispensable au choix du réducteur répondant aux besoins effectifs.

Ainsi est-il nécessaire de connaître:

#### MACHINE A ACTIONNER

- a) type de service
- b) vitesse de rotation
- c) puissance et/ou couple absorbé et/ou couple
- d) cycle de travail

#### MOTEUR

- e) type et caractéristiques du moteur
- f) puissance et/ou couple produits
- g) vitesse de fonctionnement

### ELECCIÓN DEL REDUCTOR

En una transmisión mecánica el reductor es un órgano situado entre el motor y el equipo conducido. Las solicitudes a las que se somete durante el funcionamiento son función de las curvas características del motor y del equipo conducido (potencia absorbida y ciclo de trabajo).

El conocimiento del sistema de transmisión es una condición necesaria para la correcta elección del reductor.  
Será necesario conocer:

#### EQUIPO CONDUCIDO

- a) tipo de servicio
- b) velocidad de rotación
- c) potencia y/o momento de torsión absorbido
- d) ciclo de trabajo

#### MOTOR

- e) tipo y características del motor
- f) potencia y/o momento de torsión erogado
- g) velocidad de funcionamiento

### ESCOLHA DO REDUTOR

Em um sistema de transmissão mecânica, o reductor é um órgão instalado entre o motor e o equipamento a ser acionado. As solicitações às quais é submetido durante o funcionamento dependem das curvas características tanto do motor, como do equipamento (absorção e ciclo de trabalho).

O conhecimento de todas as características do sistema de transmissão é uma condição fundamental para escolher o reductor mais adequado.

É preciso conhecer:

#### EQUIPAMENTO A SER ACIONADO

- a) tipo de serviço
- b) velocidade de rotação
- c) potência e/ou torque absorvido
- d) ciclo de trabalho

#### MOTOR

- e) tipo e características do motor
- f) potência e/ou torque fornecido
- g) velocidade de funcionamento

Queste informazioni permettono una prima scelta dei riduttori dopo aver determinato:

- rapporto di trasmissione i
- coppia di lavoro M [kNm]
- carichi sull'albero in uscita e in entrata al riduttore Fr; Fa [N]

Successivamente si dovrà procedere alle verifiche dei parametri caratteristici dei riduttori come segue:

- I) velocità in ingresso al riduttore  $\leq n_1$  max
- II) coppia di lavoro  $\leq M_c$
- III) carichi applicati all'albero in uscita e in entrata  $\leq F_r ; F_a$
- IV) potenza da trasmettere  $\leq P_t$   
(se in servizio continuo)
- V) temperatura ambiente

Le relazioni I e V sono di immediata verifica mentre per la II, la III e la IV si procede come segue:

With this information an initial drive selection can be made, determining the following:

- reduction ratio i
- working torque M [kNm]
- loads Fr and Fa [N] on drive output and input shafts

Subsequently, we must verify some specific drive parameters as follows::

- I) drive input rotation speed  $\leq n_1$  max
- II) working torque  $\leq M_c$
- III) loads on output and input shafts  $\leq F_r ; F_a$
- IV) horsepower to be transmitted  $\leq P_t$  (if under continuous duty)
- V) room temperature

Relations I and V can be readily verified; as for relations II, III and IV we must proceed as follows:

Diese Daten ermöglichen eine erste Auswahl des Getriebes und zwar nach der Festlegung von:

- Übersetzung i
- Arbeitsdrehmoment M [kNm]
- Belastung an der Abtriebs- und Antriebswelle Fr, Fa [N]

Danach sind folgende Parameter zu überprüfen:

- I) Getriebedrehzahl  $\leq n_1$  max
- II) Betriebsdrehmoment  $\leq M_c$
- III) Belastungen auf der Abtriebswelle und Antriebswelle  $\leq F_r ; F_a$
- IV) Wärmeleistung  $\leq P_t$   
(Dauerbetrieb)
- V) Umgebungstemperatur

Die Parameter I und V kann man ohne weiteres prüfen. Was II, III und IV betrifft, ist wie folgt vorzugehen:

## VERIFICA DEL RIDUTTORE IN FUNZIONE DELLA COPPIA

### Calcolo della coppia equivalente Me [kNm]

Quando il carico è variabile nel tempo (Istogramma 1), si deve determinare il valore della coppia equivalente.

Con il criterio del cumulativo di carico si calcola, con la formula sotto indicata, la coppia in grado di provocare lo stesso livello di usura dopo il numero di cicli (nxh) richiesto dal progetto.

## VERIFICATION OF THE PLANETARY UNIT ACCORDING TO THE TORQUE

### Calculation of the equivalent working torque Me [kNm]

When loads are intermittent (see Histogram 1), we must determine the equivalent working torque value.

The cumulative load principle, based on the following formula, is used to determine the torque value which produces the same fatigue after the number of cycles (nxh) required by the project:

## ÜBERPRÜFUNG DES GETRIEBES AUFGRUND DES DREHMOMENTS

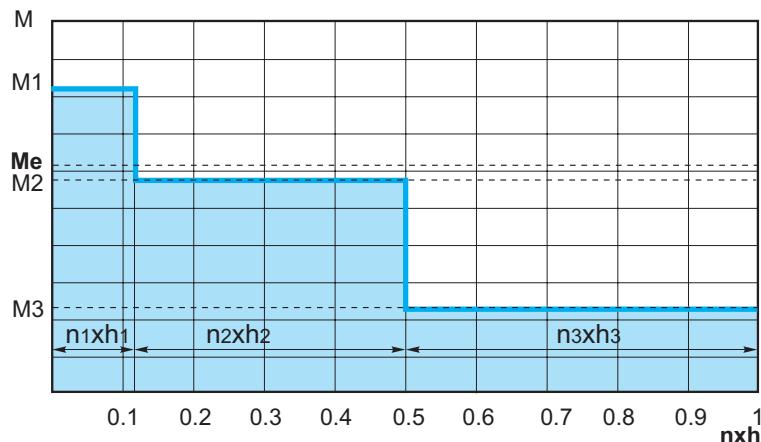

### Berechnung des äquivalenten Drehmoments Me [kNm]

Wenn die Belastung während der Einsatzdauer variiert (siehe z.B. Diagramm 1), soll man einen Durchschnittswert ermitteln.

Nach dem Lastkollektiv wird das Drehmoment mit der unten angegebenen Formel berechnet.

$$Me = \sqrt[6]{M_1^6 \frac{(n_1 \times h_1)}{(n \times h)} + M_2^6 \frac{(n_2 \times h_2)}{(n \times h)} + M_3^6 \frac{(n_3 \times h_3)}{(n \times h)}}$$

Iistogramma 1  
Histogram 1  
Histogramm 1

## CARACTÉRISTIQUES TECHNIQUES

**FR**

Ces informations permettent une première sélection après avoir établi:

- rapport de transmission i
- couple de travail M [kNm]
- charges sur l'arbre de sortie et d'entrée sur le réducteur Fr; Fa [N]

Ensuite, il est nécessaire de procéder aux contrôles des paramètres spécifiques des réducteurs, comme suit:

- I) vitesse en entrée sur le réducteur  $\leq n_1 \text{ max}$
- II) Couple de travail  $\leq Mc$
- III) charges appliquées sur l'arbre en sortie et en entrée  $\leq Fr ; Fa$
- IV) Puissance à transmettre  $\leq Pt$  (si le service est de type continu)
- V) température ambiante

Les paramètres I et V peuvent être calculés directement alors que pour les paramètres II, III et IV, il est nécessaire de procéder comme suit:

### CONTRÔLE DU RÉDUCTEUR EN FONCTION DU COUPLE

#### Calcul du couple équivalent Me [kNm]

Lorsque la charge varie dans le temps (voir histogramme 1), il est nécessaire d'établir la valeur du couple équivalent.

Par l'intermédiaire du critère du cumul des charges est calculée, au moyen de la formule ci-dessous, la valeur de couple qui détermine le même niveau d'usure à l'issue du nombre de cycles (n<sub>xh</sub>) requis par le projet.

## CARACTERÍSTICAS TÉCNICAS

**ES**

Estas informaciones permiten una primer elección de los reductores después de haber determinado:

- relación de transmisión i
- momento de trabajo M [kNm]
- cargas en el eje de salida y entrada del reductor Fr; Fa [N]

Después se tendrán que efectuar las verificaciones de los parámetros característicos de los reductores como sigue:

- I) velocidad de entrada en el reductor  $\leq n_1 \text{ máx.}$
- II) momento de trabajo III) cargas aplicadas en el eje de salida y entrada  $\leq Mc$
- III) cargas aplicadas en el eje de salida y entrada  $\leq Fr ; Fa$
- IV) potencia a transmitir  $\leq Pt$  (si el servicio es conuso)
- V) temperatura ambientetinuo)

Las relaciones I y V se verifican directamente mientras para las II, III y IV se procede como sigue:

## CARACTERÍSTICAS TÉCNICAS

**PT**

Estas informações possibilitam uma primeira seleção dos reductores após a determinação de:

- relação de transmissão i
- torque de trabalho M [kNm]
- cargas no eixo de saída e de entrada no redutor Fr; Fa [N]

Em seguida, deve-se passar às verificações dos parâmetros característicos dos reductores conforme indicado a seguir:

- I) velocidade na entrada do redutor  $\leq n_1 \text{ máx}$
- II) torque de trabalho  $\leq Mc$
- III) cargas aplicadas no eixo de saída e de entrada  $\leq Fr ; Fa$
- IV) potência que deve ser transmitida  $\leq Pt$  (se em serviço contínuo)
- V) temperatura ambiente

As relações I e V são verificáveis imediatamente, enquanto que para verificar as relações II, III e IV, procede-se da seguinte maneira:

### VERIFICACIÓN DEL REDUCTOR SEGÚN EL MOMENTO DE TORSIÓN

#### Cálculo del momento equivalente Me [kNm]

Cuando la carga varía durante el tiempo (Histograma 1), se tendrá que determinar el valor del momento equivalente.

Se emplea el criterio de la carga acumulada para calcular, con la fórmula abajo indicada, el momento capaz de producir el mismo nivel de desgaste para el número de ciclos (n<sub>xh</sub>) requerido por el proyecto.

### VERIFICAÇÃO DO REDUTOR EM FUNÇÃO DO TORQUE

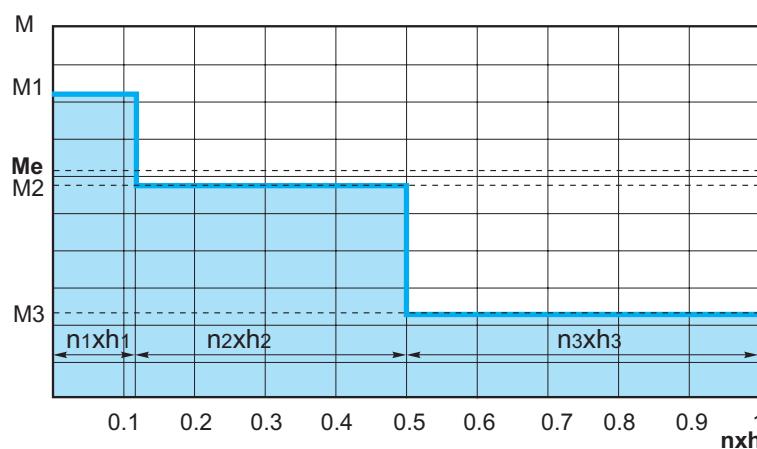

#### Cálculo do torque equivalente Me [kNm]

Quando a carga varia com o tempo (Histograma 1), deve-se determinar o valor do torque equivalente.

Adotando o princípio da carga cumulativa, calcula-se, com a fórmula indicada abaixo, o torque que produz o mesmo nível de desgaste após o número de ciclos (n<sub>xh</sub>) requerido pelo projeto.

$$Me = \sqrt[6]{M_1^6 \frac{(n_1 \times h_1)}{(n \times h)} + M_2^6 \frac{(n_2 \times h_2)}{(n \times h)} + M_3^6 \frac{(n_3 \times h_3)}{(n \times h)}}$$

Histogramme 1  
Histogram 1  
Histogramm 1

**Fattore di durata fh**

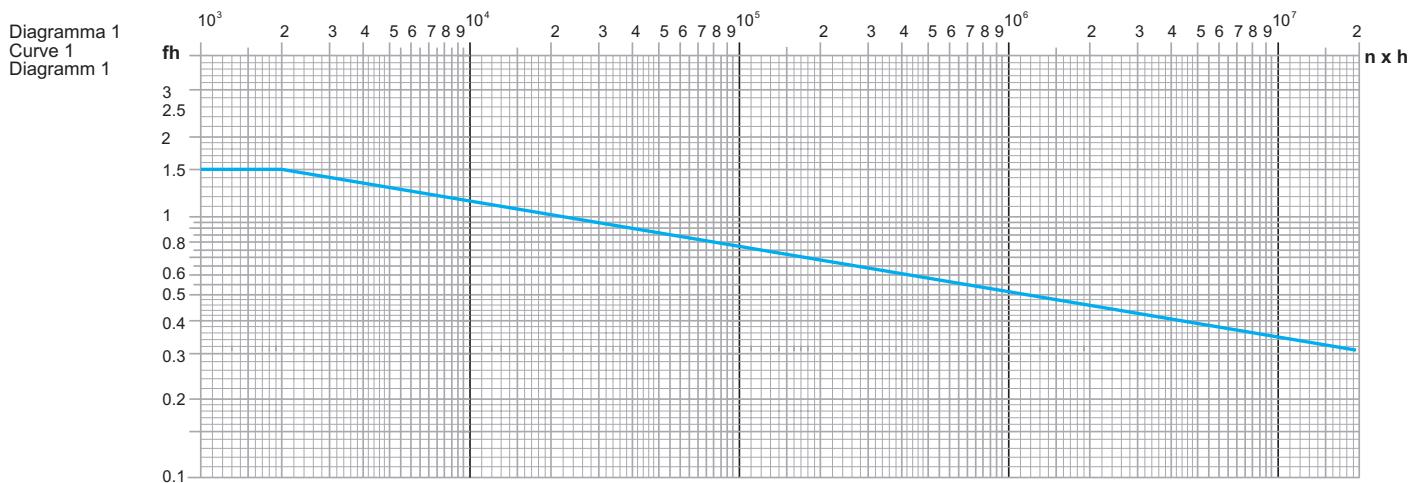

Nelle applicazioni industriali o di norma quando il numero di cicli di lavoro previsto  $n_{xh}$  supera  $2 \times 10^4$ , si rende necessario introdurre un fattore di durata fh (con l'ausilio del Diagramma 1) per adeguare il valore della coppia di catalogo  $M_c$  ad un valore che permetta di raggiungere il numero di cicli ( $n_{xh}$ ) designato a progetto.

**Duration factor fh**

In industrial installations and whenever the number of working cycles  $n_{xh}$  exceeds  $2 \times 10^4$ , we must consider a duration factor fh (see Curve 1) in order to adapt the  $M_c$  torque shown in the catalogue to a new value which allows the machine to operate at the number of cycles ( $n_{xh}$ ) required by the project.

**Lebensdauerfaktor fh**

Sollte die sich nach dem Einsatz ergebende Anzahl von Arbeitszyklen den Wert  $2 \times 10^4$  übersteigen, dann ist mit Hilfe des Diagramms 1 fh auszuwählen. Auf diese Weise wird der Katalogwert  $M_c$  an die tatsaechliche Vorgabe  $n_{xh}$  angepasst.

**Determinazione del fattore di servizio fs**

L'effetto degli urti derivanti da irregolarità del moto, dai sovraccarichi nei transitori di velocità (avviamenti ed arresti), viene conteggiato introducendo un fattore di servizio fs.  
La Tabella 2 indica i fattori fs in funzione del tipo di applicazione.

**Service factor fs calculation**

The effect of shocks generated by intermittent motion and overloads during starts and stops must be calculated, introducing a service factor fs.  
Table 2 indicates the service factors fs in relation to the type of operation.

**Betriebsfaktor fs**

Die Stöße die auf Unregelmässigkeit des Betriebes zurückzuführen sind, sowie die Spitzenbelastungen während des Einschaltoder Bremsvorgangs werden mittels des Betriebsfaktors berücksichtigt.  
Die Tabelle 2 zeigt die Betriebsfaktoren fs eingestuft nach Einsatzbedingungen

	Condizioni di carico / Load classifications / Belastungskennwert												
	U Uniforme / Uniform Gleichmässig				M Moderato / Moderate Mittelschwer				H Pesante / Heavy Schwer				
	Ore-giorno / Hours-day Stunden pro Tag	Avviamenti-ora Start-time Starts pro Stunde	< 1.0	1 - 4	4 - 8	8 - 24	< 1.0	1 - 4	4 - 8	8 - 24	< 1.0	1 - 4	4 - 8
	< 5	0.8	0.9	1.0	1.5	0.9	1.0	1.3	1.9	1.0	1.5	1.9	2.4
	5 - 50	1.0	1.0	1.4	1.7	1.0	1.3	1.6	1.9	1.4	1.8	2.1	2.5
	> 50	1.3	1.5	1.7	1.9	1.4	1.7	1.9	2.2	1.7	2.1	2.5	2.9
									fs				

Tabella 2 / Table 2 / Tabelle 2

I valori riportati sono per azionamento con motori idraulici e elettrici.

Nel caso vengano utilizzati altri tipi di motori (combustione interna), contattare il nostro Servizio Tecnico-Commerciale.

Operating values refer to drives with hydraulic and electric motors.

If other types of motors are operated (internal combustion engine), please contact our Technical-Commercial Service Department.

Die Werte gelten bei Betrieb mit Hydraulik- und Elektromotor.

Wenn die Einheiten unter abweichenden Bedingungen verwendet bzw. werden abweichende Motortypen (Verbrennungsmotoren) verwendet, setzen Sie sich bitte mit unserem Kundenservice (sales) in Verbindung.

**Facteur de duree fh**

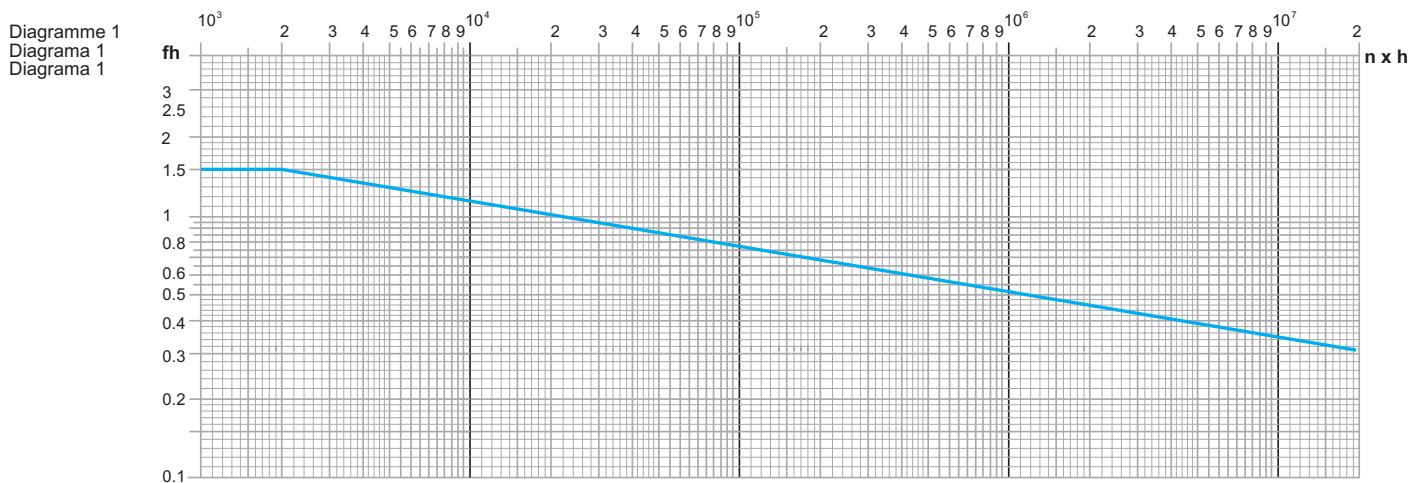

Sur toutes les applications du secteur industriel ou lorsque le nombre de cycles de travail prévu nxh dépasse  $2 \times 10^4$ , il est nécessaire d'introduire un facteur de durée fh (à l'aide du diagramme 1) dans le but d'adapter la valeur du couple de catalogue Mc à une valeur qui permette d'atteindre le nombre de cycles (nxh) requis par le projet.

**Factor de desgaste fh**

En las aplicaciones industriales o en general cuando el número de ciclos de trabajo previsto nxh supera  $2 \times 10^4$ , será necesario introducir un factor de duración fh (con la ayuda del Diagrama 1) para adecuar el valor del momento indicado en el catálogo Mc a un valor que permita alcanzar el número de ciclos (nxh) requerido en el proyecto.

**Fator de duração fh**

Nas aplicações industriais ou, normalmente, quando o número de ciclos de trabalho nxh ultrapassa  $2 \times 10^4$ , torna-se necessário introduzir um fator de duração fh (com o auxílio do Diagrama 1) para adequar o valor de torque indicado no catálogo Mc a um valor que permita atingir o número de ciclos (nxh) designado no projeto.

**Calcul du facteur de service fs**

L'effet des chocs résultant des irrégularités de mouvement, des surcharges lors des pics de vitesse (mises en marche et arrêts) est pris en compte en introduisant un facteur de service fs.

Le Tableau 2 indique les facteurs fs selon le type d'application.

**Determinación del factor de servicio fs**

El efecto de los choques ocasionados por la irregularidad del movimiento y las sobrecargas (durante las puestas en marcha y las detenciones) se deberá calcular introduciendo un factor de servicio fs.

La Tabla 2 indica los factores fs en función del tipo de aplicación.

**Determinação do fator de serviço fs**

O efeito dos choques resultantes da irregularidade do movimento e das sobrecargas nos picos de velocidade (arranques e paradas), é calculado através da introdução de um fator de serviço fs.

A Tabela 2 indica os fatores fs em função do tipo de aplicação.

Heures-jour / Horas-día / Horas por dia	Conditions de charge / Condiciones de carga / Condições de carga											
	U Uniforme / Uniforme / Uniforme				M Moyenne / Moderado / Moderada				H Lourde / Pesado / Pesada			
	< 1.0	1 - 4	4 - 8	8 - 24	< 1.0	1 - 4	4 - 8	8 - 24	< 1.0	1 - 4	4 - 8	8 - 24
Demarrages par heure Puestas en marcha-horas Arranques por hora												
< 5	0.8	0.9	1.0	1.5	0.9	1.0	1.3	1.9	1.0	1.5	1.9	2.4

> 50	1.3	1.5	1.7	1.9	1.4	1.7	1.9	2.2	1.7	2.1	2.5	2.9

Tableau 2 / Tabla 2 / Tabela 2

Les valeurs sont indiquées pour des actionnements à moteurs hydrauliques et électriques.

Pour l'utilisation d'autres types de moteur (à combustion interne), prendre contact avec le Service Technico-Commercial.

Los valores indicados son para accionamiento con motores hidráulicos y eléctricos.

Si se utilizaran otros tipos de motores (combustión interna), se aconseja ponerse en contacto con nuestro Servicio Técnico-Comercial.

Os valores indicados são válidos para acionamento com motores hidráulicos e elétricos.

Se utilizar outros tipos de motores (de combustão interna), entre em contato com o nosso Serviço Técnico Comercial.

La Tabella 3 a fine paragrafo indica alcuni esempi di classificazione delle condizioni di carico.

La relazione II è verificata dalla formula:

Table 3 at the end of this section includes some examples of load classifications.

Relationship II can be verified by using the following formula:

Die Tabelle 3 am Abschnittsende zeigt einige Beispiele der Einstufung nach Einsatzbedingungen.

Die Relation II wird mit folgender Formel überprüft:

$$M_e \times f_s \leq M_c \times f_h$$

Si richiede inoltre che  
 $M_p \leq M_{max}$

$M_p$  = coppia di picco in funzionamento

It is also required that  
 $M_p \leq M_{max}$

$M_p$  = working peak torque

Bedingung ist daß  
 $M_p \leq M_{max}$

$M_p$  = Spitzendrehmoment während des Betriebes

#### VERIFICA DEL RIDUTTORE IN FUNZIONE DEI CARICHI SULL'ALBERO DI USCITA E DI ENTRATA

#### Calcolo dei carichi equivalenti

Fre; Fae [N]

Analogamente a quanto fatto per il calcolo della coppia equivalente, quando il carico è variabile nel tempo, si deve determinare il valore del carico medio equivalente.

Con il criterio del cumulativo di carico si determina, con la formula sotto indicata, il carico in grado di provocare lo stesso livello di usura sui cuscinetti dopo il numero di cicli ( $n \times h$ ) richiesto dal progetto:

#### VERIFICATION OF THE DRIVE ACCORDING TO OUTPUT SHAFT LOADS

#### Equivalent working loads

Fre; Fae [N]

In the same manner that we calculated the equivalent working torque, when loads vary over time, we must determine the value of the average equivalent load.

As before, we use the cumulative load principle, based on the following formula, to determine the load value which produces the same fatigue on the bearings after the number of cycles ( $n \times h$ ) required by the project:

#### ÜBERPRÜFUNG DER GETRIEBEAUSWAHL NACH DER AUF DER ABTRIEBSWELLE WIRKENDEN BELASTUNGEN

#### Berechnung der equivalentbelastung

Fre; Fae [N]

Wie bereits bei der Berechnung des Drehmoments, soll man die equivalente Wellenbelastung ermitteln. Unter Berücksichtigung des Lastkollektivs wird mittels der unten angegebenen Damit wird die Haltbarkeit der Lagerung gewährleistet.

Formel die resultierende Kraft Fe ermittelt:

$$F_e = \sqrt[10/3]{F_1^{10/3} \frac{(n_1 \times h_1)}{(n \times h)} + F_2^{10/3} \frac{(n_2 \times h_2)}{(n \times h)} + F_3^{10/3} \frac{(n_3 \times h_3)}{(n \times h)}}$$

#### Fattore di servizio fs

Il fattore di servizio fs si calcola con l'ausilio delle Tabelle 2 e 3 analogamente a quanto fatto per la coppia.

La relazione III è verificata dalle formule:

#### Service factor fs

Service factor fs can be calculated using Tables 2 and 3 in the same manner as calculating the torque.

Relationship III can be verified by using the following formulas:

#### Betriebsfaktor fs

Den Betriebsfaktor fs ermittelt man mit Hilfe der Tabelle 2 und 3 mit der gleichen Vorgehensweise wie bei der entsprechenden Momentenberechnung

Die Relation III wird mit folgender Formel überprüft:

$$F_e \times f_s \leq F_r \times f_h$$

$$F_a \times f_s \leq F_a \times f_h$$

Le Tableau 3 en fin de chapitre fournit quelques exemples de classification des conditions de charge.

Le rapport II peut être vérifié par le biais de cette formule:

La Tabla 3 que está en el final del párrafo indica algunos ejemplos de clasificación de las condiciones de carga.

La relación II se verifica con la fórmula:

A Tabela 3 no fim do parágrafo indica alguns exemplos de classificação das condições de carga.

A relação II é verificada pela fórmula:

$$M_e \times f_s \leq M_c \times f_h$$

Il est nécessaire que  
 $M_p \leq M_{max}$

$M_p$  = couple de pic en fonctionnement

además se requiere que  
 $M_p \leq M_{máx}$

$M_p$  = momento de pico durante el funcionamiento

Também é necessário que  
 $M_p \leq M_{max}$

$M_p$  = torque de pico de funcionamento

### CONTRÔLE DU RÉDUCTEUR EN FONCTION DES CHARGES SUR L'ARBRE DE SORTIE ET D'ENTRÉE

#### Calcul des charges équivalentes

Fre; Fae [N]

De même que pour le calcul du couple équivalent, lorsque la charge varie dans le temps, il est nécessaire d'établir la valeur de la charge moyenne équivalente. Par l'intermédiaire du critère du cumul des charges est calculée, au moyen de la formule ci-dessous, la charge qui détermine le même niveau d'usure des roulements à l'issue du nombre de cycles (nxh) requis par le projet:

### VERIFICACIÓN DEL REDUCTOR SEGÚN LAS CARGAS EN EL EJE DE SALIDA Y DE ENTRADA

#### Cálculo de las cargas equivalentes

Fre; Fae [N]

En modo análogo a como se calculó el momento equivalente, cuando la carga varía durante el tiempo, se tendrá que determinar el valor de la carga media equivalente. Como antes, se empleó el criterio de la carga acumulada y su valor se determina con la fórmula abajo indicada, la carga es capaz de ocasionar el mismo nivel de desgaste en los rodamientos después del número de ciclos (nxh) requerido por el proyecto:

### VERIFICAÇÃO DO REDUTOR EM FUNÇÃO DAS CARGAS NO EIXO DE SAÍDA E DE ENTRADA

#### Cálculo das cargas equivalentes

Fre; Fae [N]

Analogamente às operações feitas para calcular o torque equivalente, quando a carga varia no tempo deve-se determinar o valor da carga média equivalente. Adotando o princípio da carga cumulativa determina-se, com a fórmula indicada abaixo, a carga que produz o mesmo nível de desgaste nos rolamentos após o número de ciclos (nxh) requerido pelo projeto:

$$F_e = \sqrt[10/3]{F_1^{10/3} \frac{(n_1 \times h_1)}{(n \times h)} + F_2^{10/3} \frac{(n_2 \times h_2)}{(n \times h)} + F_3^{10/3} \frac{(n_3 \times h_3)}{(n \times h)}}$$

#### Le facteur de service fs

Le facteur de service fs est calculé à l'aide des Tableaux 2 et 3 selon les mêmes principes que pour le couple.

Le rapport relation III peut être vérifié par les formules suivantes:

#### Factor de servicio fs

El factor de servicio fs se calcula con la ayuda de las Tablas 2 y 3 en modo análogo al cálculo del momento.

La relación III se verifica con las fórmulas:

#### Fator de serviço fs

Calcula-se o fator de serviço fs com o auxílio das Tabelas 2 e 3 de maneira análoga às operações feitas para o torque.

A relação III é verificada pelas fórmulas:

$$\begin{aligned} Fr \times f_s &\leq Fr \times f_h \\ Fae \times f_s &\leq Fa \times f_h \end{aligned}$$

**CARICHI RADIALI Fr [N]**

Questo capitolo vuole essere di supporto all'utilizzatore del catalogo per determinare il carico radiale massimo accettabile e/o la durata di vita dei cuscinetti degli alberi di entrata e uscita del riduttore selezionato.

**Come determinare il carico radiale massimo ammissibile di un albero di entrata o di uscita conoscendo la durata di vita richiesta dei cuscinetti e la posizione del carico.**

Parametri conosciuti:

- Versione del supporto  
Entrata:  
EL, EML, EM, EP, ET  
Uscita:  
MS, MC, PS, PC
- Distanza E [mm]  
(Distanza del carico dallo spallamento dell'albero)
- Durata di vita richiesta dei cuscinetti [h]
- Velocità di rotazione dell'albero [ $\text{min}^{-1}$ ]

Per determinare la capacità di carico radiale massimo ammissibile di un albero di entrata o di uscita, in base ai parametri conosciuti, seguire il seguente procedimento:

1. Selezionare il grafico della curva dei cuscinetti per l'albero di uscita o entrata selezionato.  
(I grafici relativi ai carichi applicabili in uscita sono riportati nelle sezioni dei dati tecnici di ogni riduttore, mentre quelli relativi agli alberi di entrata si trovano a pag. D-4).
2. Trovare nel grafico il valore del carico radiale (Fr) riferito alla distanza E.

**RADIAL LOADS Fr [N]**

This section provides the catalogue user with the information needed to determine the maximum allowable radial load and/or the service life of the bearings on input and output shafts of the selected drive.

**How to determine the admissible radial load of an input or output shaft knowing the required service life of the bearings and the load position..**

Known parameters:

- Input or output version  
Input:  
EL, EML, EM, EP, ET  
Output:  
MS, MC, PS, PC
- Distance E [mm]  
(Distance of the load position from output shaft shoulder)
- Required bearing service life [h]
- Shaft rotation speed [ $\text{min}^{-1}$ ]

To determine the admissible radial load capacity of a selected input or output shaft, based on known parameters, follow the steps described below:

1. Select the bearing service life chart for the selected input or output shaft (radial load curves for output shaft versions are shown on the drive technical sheets, while the curves for input versions can be found on pages D-4).
2. Use the curve to find the radial load (Fr) value with reference to the distance E.

**RADIALLAST Fr [N]**

Dieser Abschnitt soll dem Benutzers des Katalogs in den nachfolgenden Punkten Unterstützung bieten: die Feststellung der max. übertragbaren Radiallast und/oder der Lebensdauer der Lagerungen an An und Abtriebswelle der gewünschten Getriebeausführung.

**Wie wird die Radiallast einer Vollwelle in An- oder Abtrieb festgestellt, wenn die geforderte Lebensdauer der Lager und der Eingriffspunkt der Last bekannt sind.**

Bekannte Parameter:

- Ausführung  
Antriebswelle:  
EL, EML, EM, EP, ET  
Abtriebswelle:  
MS, MC, PS, PC
- Abstand E [mm]  
(Abstand des Lasteingriffspunktes vom Wellenansatz)
- Geforderte Lebensdauer der Lager [h]
- Drehgeschwindigkeit [ $\text{min}^{-1}$ ]

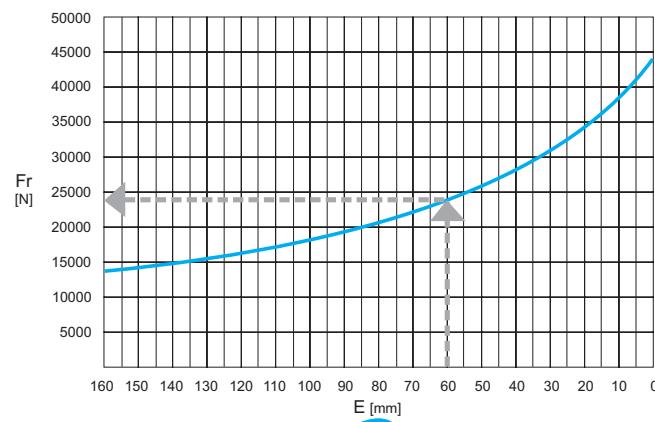

Um die Radiallast der An- oder Abtriebswelle auf der Basis der vorgenannten, bekannten Parameter zu bestimmen, ist jetzt gemäss dem folgenden Ablauf vorzugehen:

1. Auswählen der entsprechenden Grafik (Lebensdauer der Lager an An- oder Abtriebswelle) gemäss gewünschter Ausführung.  
Die entsprechenden Diagramme der uebertragbaren Radiallast im Abtrieb sind in den modellspezifischen Datenblättern ersichtlich, dagegen sind die Diagramme bezüglich des Antriebs auf den Seiten D-4 zu finden.
2. Den Radiallast-Wert (Fr) feststellen, der mit dem vorgegebenen Abstand X korrespondiert.

Esempio di diagramma della curva dei cuscinetti dei supporti di entrata e uscita.

Example of bearing service life curve for input and/or output shaft versions.

Grafisches Beispiel einer Kurve der Lagerung im Antrieb/Abtrieb.

**CHARGES RADIALES Fr [N]**

Le présent chapitre a pour but de fournir une aide à l'utilisateur du catalogue pour déterminer la charge radiale maximum admissible et/ou la durée de vie des roulements des arbres d'entrée et sortie du réducteur sélectionné.

**Comment déterminer la charge radiale maximum acceptable d'un arbre d'entrée ou de sortie en connaissant la durée de vie requise des roulements et la position de la charge.**

Paramètres connus:

- Version du support Entrée:  
EL, EML, EM, EP, ET  
Sortie  
MS, MC, PS, PC
- Distance E [mm] (distance entre la charge et la base de l'arbre)
- Durée de vie requise des roulements [h]
- Vitesse de rotation de l'arbre [ $\text{min}^{-1}$ ]

Pour déterminer la capacité de charge radiale maximum admissible d'un arbre d'entrée ou de sortie, en fonction des paramètres connus, procéder comme suit:

1. Sélectionner le graphique de la courbe des roulements pour l'arbre de sortie ou d'entrée sélectionné (les graphiques relatifs aux charges applicables en sortie figurent dans les sections des données techniques de chaque réducteur, alors que ceux relatifs aux arbres d'entrée se trouvent pages D-4).
2. Trouver sur le graphique, la valeur de la charge radiale (Fr) en fonction de la distance E.

**CARGAS RADIALES Fr [N]**

Este capítulo sirve para ayudar al usuario del catálogo a determinar la carga radial máxima aceptable y/o el tiempo de vida de los rodamientos de los ejes de entrada y salida del reductor seleccionado.

**Cómo determinar la carga radial máxima admisible de un eje de entrada o de salida conociendo el tiempo de vida requerido por los rodamientos y la posición de la carga.**

Parámetros conocidos:

- Tipo de soporte Entrada:  
EL, EML, EM, EP, ET  
Salida: MS, MC, PS, PC
- Distancia E [mm] (Distancia entre la carga y la base del eje)
- Tiempo de vida requerido de los rodamientos [h]
- Velocidad de rotación del eje [ $\text{min}^{-1}$ ]

Para determinar la capacidad admisible de carga radial de un eje de entrada o de salida, en base a los parámetros conocidos, seguir el siguiente procedimiento:

1. Seleccionar el gráfico de la curva de los rodamientos para el eje de salida o entrada seleccionado. (Los gráficos de las cargas aplicables en los ejes de salida se indican en las secciones de los datos técnicos de cada reductor, mientras que los gráficos de los ejes de entrada se encuentran en la Pág. D-4).
2. Encontrar en el gráfico el valor de la carga radial (Fr) referida a la distancia E.

**CARGAS RADIAIS Fr [N]**

A finalidade deste capítulo é a de fornecer um auxílio ao usuário do catálogo para determinar a carga radial máxima aceitável e/ou a vida útil dos rolamentos dos eixos de entrada e de saída do redutor selecionado.

**Como determinar a carga radial máxima admissível de um eixo de entrada ou de saída conhecendo a vida útil requerida dos rolamentos e a posição da carga.**

Parâmetros conhecidos

- Versão do suporte Entrada:  
EL, EML, EM, EP, ET  
Saída:  
MS, MC, PS, PC
- Distância E [mm] (Distância entre a carga e a base do eixo)
- Vida útil requerida dos rolamentos [h]
- Velocidade de rotação do eixo [ $\text{min}^{-1}$ ]

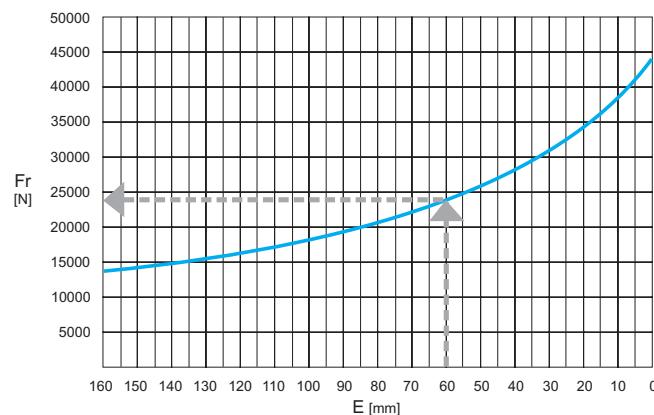

Para determinar a capacidade de carga radial máxima admissível de um eixo de entrada ou de saída, com base nos parâmetros conhecidos, siga este procedimento:

1. Selecione o gráfico da curva dos rolamentos para o eixo de saída ou de entrada selecionado. (Os gráficos das cargas aplicáveis na saída estão reproduzidos nas seções de dados técnicos de cada redutor, enquanto que os gráficos dos eixos de entrada estão reproduzidos nas págs. D-4).
2. Localize no gráfico o valor da carga radial (Fr) referida à distância E.

Exemple de diagramme de la courbe des roulements des supports d'entrée et de sortie

Ejemplo de diagrama de la curva de los rodamientos de los soportes de entrada y salida.

Exemplo de diagramma da curva dos rolamentos dos suportes de entrada e saída

3. Il valore di Fr trovato è il valore di carico radiale massimo accettabile nella posizione E per una durata di vita dei cuscinetti h di:

Albero di uscita

3. Fr will be the max. load the shaft can bear at position E for a bearing service life h of:

Output version

3. Der festgestellte Wert (Fr) ist die max. tragbare Radiallast in Verbindung zum Abstand E bei einer Lebensdauer der Lager h von:

Abtriebswelle

$$h = \frac{10^5}{n_2}$$

Albero di entrata

Input version

Antriebswelle

$$h = \frac{5 \times 10^6}{n_1}$$

$h$  = Durata di vita dei cuscinetti [h]

$n_1$  = Velocità di rotazione dell'albero entrata [ $\text{min}^{-1}$ ]

$n_2$  = Velocità di rotazione dell'albero uscita [ $\text{min}^{-1}$ ]

$h$  = Bearings life time [h]

$n_1$  = Input shaft speed [ $\text{min}^{-1}$ ]

$n_2$  = Output shaft speed [ $\text{min}^{-1}$ ]

$h$  = Lebensdauer der Lager [h]

$n_1$  = Drehgeschwindigkeit der Antriebswelle [ $\text{min}^{-1}$ ]

$n_2$  = Drehgeschwindigkeit der Antriebswelle [ $\text{min}^{-1}$ ]

Nel caso la durata di vita dei cuscinetti, calcolata con le suddette formule, non corrisponda a quella richiesta occorrerà determinare il coefficiente di correzione del carico radiale per ottenere la durata richiesta seguendo il seguente procedimento:

4. Determinare il numero di cicli che l'albero compierà durante la durata di vita richiesta:  
 $nh = n_{1-2} [\text{min}^{-1}] \times h [\text{h}]$ .

5. Determinare, nel grafico del coefficiente di correzione del carico radiale, il valore K corrispondente al numero di cicli calcolati al punto 1.  
(I grafici relativi ai coefficienti di correzione riferiti ai carichi applicabili in uscita sono riportati nelle sezioni dei dati tecnici di ogni riduttore, mentre quelli relativi agli alberi di entrata si trovano a pag. D-4).

If the bearing service life, as calculated with the previous formulas, does not meet customer requirements, the radial load correction factor that would allow the bearings to meet the service life requirements must be determined according to the following procedure:

4. Determine the no. of cycles that the shaft will complete during the required service life:  
 $nh = n_{1-2} [\text{min}^{-1}] \times h [\text{h}]$

5. Use the radial load correction factor curve to determine the K value corresponding to the no. of cycles calculated in point 1.  
(radial load correction factor curves for output shaft versions are shown on the drive technical sheets, while the curves for input versions can be found on pages D-4).

Für den Fall, dass die so kalkulierte Lebensdauer nicht mit der geforderten Lebensdauer übereinstimmt, wird der Korrekturkoeffizient K der Radiallast eingesetzt. Dieses wird mit dem nachfolgenden Ablauf erreicht:

4. Bestimmung von Anzahl der Zyklen über die geforderte Lebensdauer der Lager:

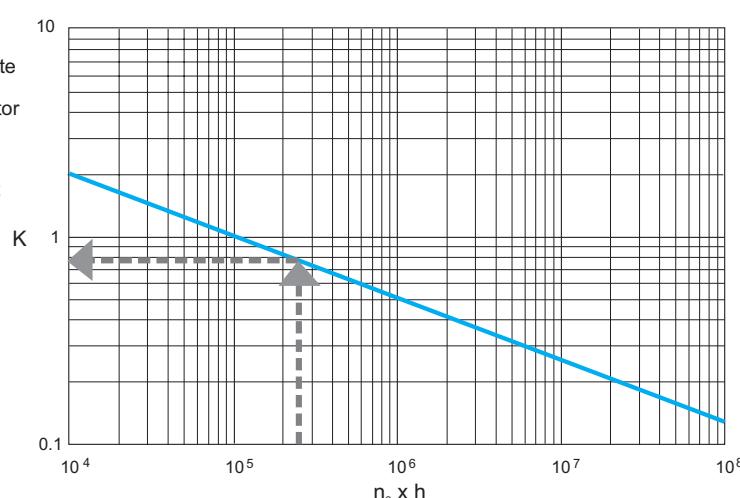

$$nh = n_{1-2} [\text{min}^{-1}] \times h [\text{h}]$$

5. Feststellen des Korrekturkoeffizienten (K) der Radiallast in der entsprechenden Grafik - korrespondierend mit dem Punkt 1. Die entsprechenden Diagramme des Korrekturkoeffizienten im Bezug auf die tragbare Radiallast im Abtrieb sind in den modellspezifischen Datenblättern ersichtlich, dagegen sind die Diagramme bezüglich des Antriebs auf den Seiten D-4 zu finden.

Esempio di diagramma del coefficiente di correzione del carico radiale.

CARACTERÍSTICAS  
TÉCNICAS

ES

CARACTERÍSTICAS  
TÉCNICAS

PT

3. La valeur  $F_r$  trouvée est la valeur de charge radiale maximum acceptable dans la position E pour une durée de vie des roulements  $h$  de:

Arbre de sortie

Eje de salida

Eixo de saída

$$h = \frac{10^5}{n_2}$$

Arbre d'entrée

Eje de entrada

Eixo de entrada

$$h = \frac{5 \times 10^6}{n_1}$$

$h$  = durée de vie des roulements (h)

$n_1$  = vitesse de rotation l'arbre d'entrée [min<sup>-1</sup>]  
 $n_2$  = vitesse de rotation de l'arbre de sortie [min<sup>-1</sup>]

$h$  = Tiempo de vida útil de los rodamientos (h)

$n_1$  = Velocidad de rotación del eje de entrada [min<sup>-1</sup>]  
 $n_2$  = Velocidad de rotación del eje de salida [min<sup>-1</sup>]

$h$  = Vida útil dos rolamentos (h)

$n_1$  = Velocidade de rotação do eixo de entrada [min<sup>-1</sup>]  
 $n_2$  = Velocidade de rotação do eixo de saída [min<sup>-1</sup>]

Si la durée de vie des roulements, calculée par le biais des formules indiquées plus haut, ne correspond pas à celle requise, il est nécessaire de déterminer le coefficient de correction de la charge radiale pour obtenir la durée requise en procédant comme suit:

4. Établir le nombre de cycles accomplis par l'arbre pendant la durée de vie requise:  
 $n_{xh} = n_{1-2} [\text{min}^{-1}] \times h [\text{h}]$

5. Établir, à l'aide du graphique du coefficient de correction de la charge radiale, la valeur  $K$  correspondant au nombre de cycles calculé au point 1 (les graphiques relatifs aux coefficients de correction des charges applicables en sortie figurent dans les sections des données techniques de chaque réducteur, tandis que ceux relatifs aux arbres d'entrée se trouvent pages D-4).

Si el tiempo de vida de los rodamientos, calculado con las respectivas fórmulas, no correspondiera al solicitado será necesario determinar el coeficiente de corrección de la carga radial para obtener la duración requerida de los rodamientos siguiendo el siguiente procedimiento:

4. Determinar el número de ciclos que efectuará el eje durante el tiempo de vida requerido:  
 $n_{xh} = n_{1-2} [\text{min}^{-1}] \times h [\text{h}]$

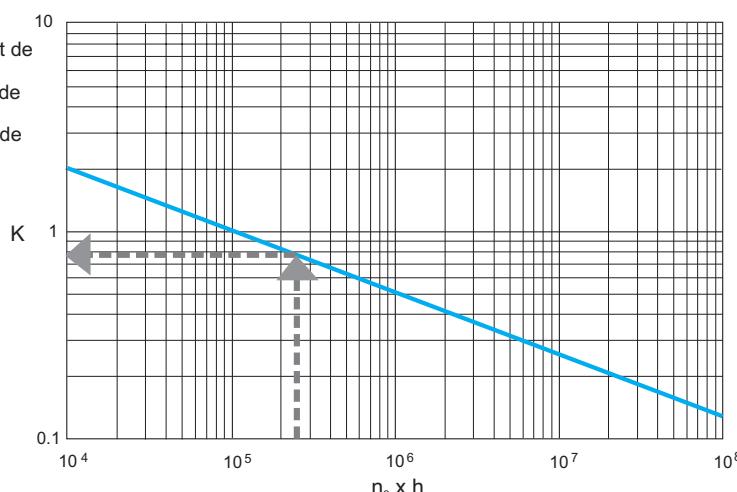

5. Determinar, en el gráfico del coeficiente de corrección de la carga radial, el valor  $K$  correspondiente al número de ciclos calculado en el punto 1. (Los gráficos de los coeficientes de corrección para las cargas aplicadas en los ejes de salida se indican en las secciones de los datos técnicos de cada reductor, mientras que los datos de los ejes de entrada se encuentran en la Pág. D-4).

Se a vida útil dos rolamentos, calculada com as fórmulas acima indicadas, não coincidir com a requerida, será preciso determinar o coeficiente de correção da carga radial para obter a vida útil requerida adotando este procedimento:

4. Determine o número de ciclos que o eixo irá realizar durante a vida útil requerida:  
 $n_{xh} = n_{1-2} [\text{min}^{-1}] \times h [\text{h}]$

5. No gráfico do coeficiente de correção da carga radial, determine o valor  $K$  correspondente ao número de ciclos calculado no ponto 1. (Os gráficos dos coeficientes de correção referidos às cargas aplicáveis na saída estão reproduzidos nas seções de dados técnicos de cada reductor, enquanto que os gráficos dos eixos de entrada estão reproduzidos nas págs. D-4).

Exemple de diagramme du coefficient de correction de la charge radiale.  
 Ejemplo de diagramma del coeficiente de corrección de la carga radial.  
 Exemplo de diagrama do coeficiente de correção da carga radial.

6. Ora potrete definire quale sarà il carico massimo accettabile  $F_{r_{nh}}$  nella posizione E che garantirà la durata di vita dei cuscinetti richiesta applicando la seguente formula:

6. Now you can determine the acceptable radial load  $F_{r_{nh}}$  at the known position E to meet the bearing service life requirements, applying the following formula:

6. Jetzt kann einwandfrei bestimmt werden, welche Radiallast  $F_{r_{nh}}$  (auf der Basis des vorgegebenen Abstands E) annehmbar ist, um die geforderte Lebensdauer der Lager garantieren zu können:

$$F_{r_{nh}} = Fr \times K$$

**Come determinare la durata di vita richiesta dei cuscinetti di un albero di entrata o di uscita conoscendo il carico radiale applicato e la posizione del carico.**

Parametri conosciuti:

- Versione del supporto Entrata:  
EL, EML, EM, EP, ET
- Uscita:  
MS, MC, PS, PC
- Distanza E [mm]  
(Distanza del carico dallo spallamento dell'albero)
- Carico radiale applicato [kN]
- Velocità di rotazione dell'albero [min-1]

Per determinare la durata di vita dell'albero di entrata o di uscita scelto, in base ai parametri conosciuti, seguire il seguente procedimento:

1. Selezionare il grafico della durata di vita dei cuscinetti dell'albero di entrata o uscita selezionato.

2. Individuare nel grafico il carico radiale (Fr) riferito alla posizione del carico E.

3. Determinare il fattore di correzione del carico radiale K applicando la seguente formula:

**How to determine the bearing service life of an input or output shaft version knowing the applied radial load and its load position.**

Known parameters:

- Input or output version
- Input:  
EL, EML, EM, EP, ET
- Output:  
MS, MC, PS, PC
- Load position E [mm]  
(Distance of the load from the output shaft shoulder)
- Applied radial load [kN]
- Shaft speed [min-1]

To determine the bearing service life of the selected input or output shaft, based on known parameters, follow the steps described below:

1. Select the service life curve of the bearings for the selected input or output shaft.

2. Use the chart to find the radial load (Fr) with reference to the load position E.

3. Determine the radial load correction factor K applying the following formula:

**Wie wird die Lebensdauer der Lager einer Vollwelle in An- oder Abtrieb festgestellt, wenn die Radiallast und der entsprechende Eingriffspunkt vorgegeben sind.**

Bekannte Parameter:

- Ausführung  
Antriebswelle:  
EL, EML, EM, EP, ET
- Abtriebswelle:  
MS, MC, PS, PC
- Abstand E [mm]  
(Abstand des Lasteingriffspunktes vom Wellenansatz)
- Applizierte Radiallast [kN]
- Drehgeschwindigkeit [min-1]

Um die Lebensdauer der Lager der Anoder Abtriebswelle auf der Basis der vorgenannten, bekannten Parameter zu bestimmen, ist jetzt gemäss dem folgenden Ablauf vorzugehen:

1. Auswählen der entsprechenden Grafik (Lebensdauer derr Lager an Anoder Abtriebswelle) gemäss gewünschter Ausführung.

2. Den Radiallast-Wert (Fr) feststellen, der mit dem vorgegebenen Abstand E korrespondiert.

3. Den Korrekturkoeffizienten K der Radial last nach der folgenden Formel bestimmen:

$$K = \frac{Fr_{ap}}{Fr}$$

$Fr_{ap}$  = Carico radiale applicato [kN]

$Fr_{ap}$  = Applied radial load [kN]

$Fr_{ap}$  = applizierte Radiallast [kN]

4. Una volta determinato il fattore K individuare sul grafico del fattore di correzione del carico radiale il valore di  $nxh$  corrispondente.

4. Once you have determined the K factor, use the radial load correction factor curve to find the corresponding ( $nxh$ ) value.

5. Infine per determinare la durata di vita dei cuscinetti riferito al carico radiale applicato ed alla sua posizione E applicare la seguente formula:

5. Finally, to determine the bearing service life based on the applied radial load and its position E, apply the following formula:

4. Den ermittelten Koeffizienten K der Radiallast in der entsprechenden Darstellung mit dem korrespondierenden Wert  $nxh$  in Verbindung setzen.

5. Jetzt kann einwandfrei bestimmt werden, welche Lebensdauer der Lager in Verbindung zur vorgegebenen Radiallast (auf der Basis des vorgegebenen Abstands E) annehmbar ist. Dazu ist die nachfolgende Formel einzusetzen:

$$h = \frac{n \times h}{n_{1-2}}$$

6. Il est à présent possible de définir la charge maximum acceptable  $Fr_{n_x}$  dans la position E connue qui garantira la durée de vie requise des roulements, en appliquant la formule suivante:

6. Ahora se podrá definir cuál será la carga máxima aceptable  $Fr_{n_x}$  en la posición E que podrá garantizar el tiempo de vida requerido de los rodamientos, aplicando la siguiente fórmula:

6. Agora poderá definir qual será a carga máxima aceitável  $Fr_{n_x}$  na posição E que irá garantir a vida útil requerida para os rolamentos aplicando a seguinte fórmula:

$$Fr_{n_x} = Fr \times K$$

**Comment déterminer la durée de vie requise des roulements d'une d'arbre d'entrée ou de sortie en connaissant la charge radiale appliquée et sa position.**

Paramètres connus:

- Version du support:  
Entrée:  
EL, EML, EM, EP, ET  
Sortie:  
MS, MC, PS, PC
- Distance E [mm]  
(distance entre la charge et la base de l'arbre)
- Charge radiale appliquée [kN]
- Vitesse de rotation l'arbre [min-1]

Pour déterminer la durée de vie de l'arbre d'entrée ou de sortie choisi, en fonction des paramètres connus, procéder comme suit:

1. Sélectionner le graphique de la durée de vie des roulements de l'arbre d'entrée ou de sortie sélectionné.
2. Trouver dans le graphique la charge radiale (Fr) correspondant à la position de la charge E.
3. Déterminer le facteur de correction de la charge radiale K en appliquant la formule suivante:

**Cómo determinar el tiempo de vida útil requerido de los rodamientos de un eje de entrada o de salida conociendo la carga radial aplicada y la posición de la carga.**

Parámetros conocidos:

- Versión del soporte  
Entrada:  
EL, EML, EM, EP, ET  
Salida:  
MS, MC, PS, PC
- Distancia E [mm]  
(Distancia entre la carga y la base del eje)
- Carga radial aplicada [kN]
- Velocidad de rotación del eje [min-1]

Para determinar el tiempo de vida útil del eje de entrada o de salida elegido, en base a los parámetros conocidos, seguir el siguiente procedimiento:

1. Seleccionar el gráfico del tiempo de vida útil de los rodamientos del eje de entrada o de salida seleccionado.
2. Localizar en el gráfico la carga radial (Fr) correspondiente a la posición de la carga E.
3. Determinar el factor de corrección de la carga radial K aplicando la siguiente fórmula:

$$K = \frac{Fr_{ap}}{Fr}$$

**Como determinar a vida útil requerida dos rolamentos de um eixo de entrada ou de saída conhecendo a carga radial aplicada e a posição da carga.**

Parámetros conhecidos:

- Versao do suporte  
Entrada:  
EL, EML, EM, EP, ET  
Saída:  
MS, MC, PS, PC
- Distância E [mm]  
(Distância entre a carga e a base do eixo)
- Carga radial aplicada [kN]
- Velocidade de rotagao do eixo [min-1]

Para determinar a vida útil do eixo de entrada ou de saída escolhido, com base nos parâmetros conhecidos, siga este procedimento:

1. Selecione o gráfico de vida útil dos rolamentos do eixo de entrada ou de saída selecionado.
2. Localize no gráfico a carga radial (Fr) referida à posigao da carga E.
3. Tendo determinado o fator K, localize no gráfico do fator de correção da carga radial o valor de nxh correspondente.

$Fr_{ap}$  = Charge radiale appliquée [kN]

$Fr_{ap}$  = Carga radial aplicada [kN]

$Fr_{ap}$  = Carga radial aplicada [kN]

4. Une fois établi le facteur K; trouver dans le graphique du facteur de correction de la charge radiale, la valeur de nxh correspondante.
5. Établir enfin la durée de vie des roulements en fonction de la charge radiale appliquée et de sa position E, et appliquer la formule suivante:

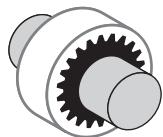

4. Después de determinar el factor K localizar en el gráfico del factor de corrección de la carga radial el correspondiente valor de nxh.
5. Por último, determinar el tiempo de vida útil de los rodamientos basándose en la carga radial aplicada y a su posición E utilizando la siguiente fórmula:

4. Tendo determinado o fator K, localize no gráfico do fator de correção da carga radial o valor de nxh correspondente.
5. Por fim, para determinar a vida útil dos rolamentos referida à carga radial aplicada e à sua posição E, aplique a seguinte fórmula:

$$h = \frac{n \times h}{n_{1-2}}$$

Il carico radiale  $F_{r_a}$  agente sull'albero del riduttore può essere calcolato con le seguenti formule secondo il tipo di trasmissione adottata.

Giunto elastico  
Elastic coupling  
Elastische Kupplung

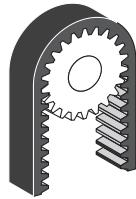

No carico radiale  
No radial load  
Keine Radiallast

Ingranaggi a denti diritti (angolo pressione 20°)  
Spur gear (pressure angle 20°)  
Zahnräder mit gerader Verzahnung (Druckwinkel 20°)

$$F_{r_a} = \frac{2100 \cdot M_2}{D}$$

Pulegge dentate  
Trigger belt  
Zahnriemen

$$F_{r_a} = \frac{2100 \cdot M_2}{D}$$

Pulegge a gole V  
Pulley for V belt  
Keilriemen

$$F_{r_a} = \frac{4000 \cdot M_2}{D}$$

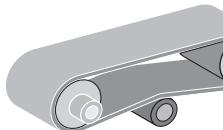

Die auf die Getriebewelle einwirkende Radiallast  $F_{r_a}$  kann je nach angewandtem Getriebetyp mit folgenden Formeln berechnet werden.

Catene a bassa velocità ( $z < 17$ )  
Chain drives at low speed ( $z < 17$ )  
Kettengetriebe mit niedriger Geschwindigkeit ( $z < 17$ )

$$F_{r_a} = \frac{2100 \cdot M_2}{D}$$

Cinghia piana con tenditore  
Flat belt with spanning pulley  
Flachriemen mit spanner

$$F_{r_a} = \frac{8000 \cdot M_2}{D}$$

$F_{r_a}$  = Carico radiale risultante sull'albero [N]

$M_2$  = Momento torcente sull'albero [Nm]

D = Diametro primitivo ingranaggio o puleggia [mm]

$F_{r_a}$  = Radial load on shaft [N]

$M_2$  = Torque on shaft [Nm]

D = Gear or pulley pitch diameter [mm]

$F_{r_a}$  = Radiallast an der Welle [N]

$M_2$  = Drehmoment an der Welle [Nm]

D = Teilkreisdurchmesser des Zahnrad oder der Riemenscheibe [mm]

## VERIFICA DEL RIDUTTORE IN FUNZIONE DELLA POTENZA TERMICA

Pt [kW]

Nel caso in cui il riduttore sia utilizzato a velocità di uscita superiore a  $20 \text{ min}^{-1}$  ed in servizio continuo, o comunque abbia sostato una inserzione e l'altra tali da non consentire il normale smaltimento del calore, è necessario verificare che la potenza effettivamente trasmessa non superi quella indicata nella scheda tecnica relativa al singolo tipo di riduttore.

## VERIFICATION OF THE DRIVE ACCORDING TO THE THERMAL POWER

Pt [kW]

When the drive is used with an output speed greater than  $20 \text{ min}^{-1}$  under continuous duty or with stops between applications that inhibit normal heat dissipation, make sure that the actual transmitted power does not exceed the power indicated on the data sheet of the individual drive.

## ÜBERPRÜFUNG DES GETRIEBES AUFGRUND DER THERMISCHEN LEISTUNG

Pt [kW]

Wird das Getriebe im Dauerbetrieb bei Raumtemperatur und mit einer Abtriebsdrehzahl von über  $20 \text{ min}^{-1}$  ein gesetzt bzw. mit Unterbrechungen zwischen den Einschaltungen, die zu kurz sind, um die normale Wärmeableitung zu gewährleisten, muss kontrolliert werden, dass die tatsächlich übertragene Leistung nicht den Wert überschreitet, der in den jeweiligen Getriebetypen zugeordneten technischen Datenblättern verzeichnet ist.

Per i riduttori di grosse dimensioni vi possono essere limitazioni alla velocità max in entrata, di cui si deve tenere conto e che sono indicate sempre nella scheda tecnica del prodotto.

For large drives, the maximum input speeds, as always shown on the product's data sheet, must be taken into account.

Bei großen Getrieben können zulässige Höchstwerte für die Eingangsgeschwindigkeit vorgeschrieben sein, die generell im technischen Datenblatt des Produkts aufgeführt sind und eingehalten werden müssen.

Le informazioni tecniche contenute nel presente catalogo intendono essere una rapida guida alla scelta dei riduttori e non vogliono in nessun caso sostituirsi alle conoscenze ed all'esperienza dei tecnici impiantisti cui spetta il compito di determinare i riduttori da installare.

Nello spirito della migliore collaborazione con i clienti, la Comer Industries S.p.A. è lieta di mettere a disposizione il proprio servizio tecnico per le verifiche che si rendano necessarie.

The technical information in this catalog is provided as a brief guide for selecting drives and does not substitute the knowledge and experience of the installers who are responsible for selecting the proper drive.

To collaborate as much as possible with its customers, Comer Industries S.p.A. is pleased to offer the services of its technical assistance department to carry out any necessary verifications.

Die im Katalog enthaltenen technischen Informationen sollen eine Hilfe zur möglichst einfachen Auswahl der Getriebe sein. Diese Informationen sollen auf keinen Fall die Kenntnisse und die Erfahrung der Anlagentechniker ersetzen, die zu bestimmten haben, welcher Getriebetyp installiert werden muss.

Für eine optimale Zusammenarbeit steht der Kundenservice von Comer Industries S.p.A. Ihnen für jegliche Überprüfung und Beantwortung sonstiger technischer Fragen zur Verfügung.

La charge radiale  $F_{r_a}$  qui agit sur l'arbre du réducteur peut être calculée par le biais des formules ci-dessous selon le type de transmission adopté.

Joint élastique  
Unión elástica  
Acoplamiento flexible

Aucune charge radiale  
No carga radial  
Sem carga radial

La carga radial  $F_{r_a}$  que actúa sobre el eje del reductor se puede calcular con las siguientes fórmulas según el tipo de transmisión utilizado.

Engrenages à dents droites (angle pression 20°)  
Engranajes de dientes rectos (ángulo presión 20°)  
Engrenagens de dentes retos (ângulo de pressão 20°)

$$F_{r_a} = \frac{2100 \cdot M_2}{D}$$

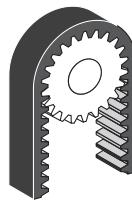

A carga radial  $F_{r_a}$  que atua no eixo do reductor pode ser calculada com as seguintes fórmulas, em função do tipo de transmissão adotado.

Pour réducteur à chaîne à basse vitesse ( $z < 17$ )  
Para redutor cadena a baja velocidad ( $z < 17$ )  
Para redutor de corrente com baixa ( $z < 17$ )

$$F_{r_a} = \frac{2100 \cdot M_2}{D}$$

Pour courroie dentée  
Para correa dentada  
Para correia dentada

$$F_{r_a} = \frac{2100 \cdot M_2}{D}$$

Pour courroie trapézoïdale  
Para correa trapezoidal  
Para correia trapezoidal

$$F_{r_a} = \frac{4000 \cdot M_2}{D}$$

Courroie plate avec tendeur  
Correa plana con tensor  
Correia plana com esticador

$$F_{r_a} = \frac{8000 \cdot M_2}{D}$$

CONTRÔLE DU RÉDUCTEUR EN  
FONCTION DE LA PUISSANCE  
THERMIQUE  
Pt [kW]VERIFICACIÓN DEL REDUCTOR  
SEGÚN LA POTENCIA TÉRMICA  
Pt [kW]VERIFICAÇÃO DO REDUTOR EM  
FUNÇÃO DA POTÊNCIA TÉRMICA  
Pt [kW]

Dans le cas où le réducteur serait utilisé à une vitesse de sortie supérieure à  $20 \text{ min}^{-1}$  et en service continu, ou bien que les arrêts de fonctionnement entre un enclenchement et l'autre ne seraient pas suffisamment longs pour permettre la dissipation normale de la chaleur, il est nécessaire de s'assurer que la puissance effectivement transmise ne dépasse pas celle indiquée sur la fiche technique du réducteur. En ce qui concerne les réducteurs de grandes dimensions, peuvent exister des limitations à la vitesse maximum en entrée, limitations dont il est nécessaire de tenir compte et qui sont indiquées sur la fiche technique du produit.

Cuando se utilice el reductor con una velocidad de salida superior a  $20 \text{ min}^{-1}$  y con servicio continuo o de todas maneras con paradas entre una activación y otra tales que no permitan una dissipación normal del calor, será necesario comprobar que la potencia efectivamente transmitida no supere aquella indicada en la respectiva ficha técnica del reductor. Para los reductores de grandes dimensiones puede haber unas limitaciones de la velocidad máx. de entrada, habrá que tener en cuenta dichas limitaciones que siempre vienen indicadas en la ficha técnica del producto.

Se o redutor for utilizado com uma velocidade de saída maior do que  $20 \text{ min}^{-1}$  e em serviço contínuo ou se funcionar com paradas entre duas ativações consecutivas que não permitam a dissipação normal do calor, será necessário verificar se a potência efetivamente transmitida não ultrapassa a indicada na ficha técnica do tipo de redutor em questão. Para os redutores de grandes dimensões, podem existir limitações para a velocidade máxima de entrada. Estas limitações devem ser levadas em conta e são sempre indicadas na ficha técnica do produto.

Les informations techniques figurant dans le présent catalogue constituent une aide dans le choix des réducteurs et ne sauraient se substituer aux connaissances ni à l'expérience des techniciens d'installation auxquels ils incombe d'établir le type de réducteur à installer.

Dans une optique de collaboration efficace avec les clients, Comer Industries S.p.A. met à la disposition de ceux-ci ses propres services techniques pour tout contrôle éventuellement nécessaire.

Las informaciones técnicas contenidas en este catálogo sirven como guía rápida para la elección de los reductores y en ningún caso se proponen sustituir los conocimientos y la experiencia de los técnicos en instalaciones que tienen la tarea de seleccionar los reductores a instalar.

Queriendo siempre colaborar con los clientes, Comer Industries S.p.A. pone con mucho gusto a disposición su propio Servicio Técnico para efectuar las comprobaciones que fueran necesarias.

As informações técnicas contidas neste catálogo são fornecidas com o intuito de auxiliar o usuário na escolha dos reductores e com elas não se pretende, de nenhuma maneira, substituir os conhecimentos e a experiência dos técnicos de instalação responsáveis por determinar os reductores que devem ser instalados.

Na óptica da melhor colaboração com os clientes, a Comer Industries S.p.A. põe à sua disposição o próprio serviço técnico para realizar as averiguações que se tornem necessária.

**CONDIZIONI DI CARICO**

Le condizioni di carico qui elencate possono subire variazioni in funzione delle reali condizioni di funzionamento dei riduttori.

**LOAD CLASSIFICATION**

Listed load conditions may change depending on drive actual operating conditions.

**BELASTUNGSKENNWERT**

Die Änderung des erforderlichen Belastungskennwertes kann ggf. nach Angabe der genauen Betriebsbedingungen erfolgen.

## NORME GENERALI PER L'INSTALLAZIONE E LA MANUTENZIONE

Per garantire un buon funzionamento dei riduttori ed una miglior durata nel tempo è necessario un corretto accoppiamento alla struttura cui viene fissato il gruppo. Pertanto le superfici di tale struttura dovranno essere lavorate con centraggi in H8 ed in modo da garantire un'ottima planarità e perpendicolarità con l'asse del riduttore.

Per il fissaggio del riduttore usare la bulloneria indicata sotto ogni disegno nelle schede tecniche di prodotto. Usare inoltre tutti i fori di fissaggio previsti sulle flange dei riduttori.

Per gruppi installati all'aperto si consiglia, dove possibile, di proteggere i riduttori dalle intemperie, di trattarli con sistemi anticorrosivi e di proteggere i paraoli con grasso idrorepellente.

Nelle applicazioni in cui possono verificarsi sovraccarichi accidentali tali da compromettere l'integrità della trasmissione, occorre prevedere un sistema di sicurezza (idraulico, meccanico) per salvaguardare il riduttore.

L'abbinamento fra riduttori e motori, principalmente elettrici o idraulici, viene normalmente fatto mediante flangiatura diretta quando non si presentano particolari condizioni di criticità, che possono provocare danni dopo l'installazione.

A tale proposito, ove è richiesto di installare motori molto pesanti, oltre i 100 Kg, consigliamo di contattare il nostro Servizio Tecnico-Commerciale, per meglio valutare l'applicazione in funzione della posizione di montaggio.

In alternativa, si consiglia un montaggio separato dei due particolari collegati mediante giunto o pulegge.

## SMALTIMENTO DELLA MACCHINA

Lo smaltimento dei rifiuti derivati dalla demolizione della macchina dovrà essere eseguito nel rispetto ambientale, evitando di inquinare suolo, aria e acqua. I rifiuti derivanti dalla demolizione della macchina sono classificabili come rifiuti speciali. In ogni caso dovranno essere rispettate le locali legislazioni e le normative di tutela ambientale nel rispetto delle leggi vigenti in materia nel paese di utilizzo della macchina.

Materiali ferrosi: trattasi di materiale riciclabile (materie prime secondarie) da conferire ad apposito centro di raccolta autorizzato.

Materiali plastici: riciclo consentito ove effettuato, smaltimento in discarica per rifiuti assimilabili agli urbani, incenerimento consentito in impianto dotato di post-combustione e sistema di abbattimento polveri prima dell'immissione in atmosfera.

## GENERAL MOUNTING AND MAINTEANCE INSTRUCTIONS

For the longest and most efficient service life, drives must be correctly mounted on the application structure. Therefore, all structure faces must be machined with H8 spigots so that they are flat and perpendicular to the drive axis.

To secure the drive, use the nuts and bolts shown under each technical drawing on the product technical sheets. Make sure to use all the fixing holes on the flanges.

For outdoor installations, drives must be protected against bad weather, treated with anticorrosive agents and oil seals protected with water-repellent grease.

In operations in which transmission malfunctions might occur due to accidental overloads, a mechanical or hydraulic safety device must be used to protect the drive.

Drives are usually connected directly to what are mainly electric or hydraulic motors by means of flanges when there are particularly critical conditions that might cause damage after installation.

With this in mind, and when heavy motors must be installed (weighing more than 100 Kg), please contact our Technical-Commercial Service Department, to evaluate the proper mounting position.

As an alternative, we suggest to separately mount the two units and to connect them with either a coupling or pulleys.

## MACHINE DISPOSAL

Disposing of waste deriving from demolition of the machine must be done with the environment in mind, avoiding pollution of the soil, air and water. Waste from demolition of the machine is classified as special waste. Local laws and environmental protection regulations must in any case be observed, in compliance with the environmental laws in force in the country where the machine is used.

Ferrous materials: these are recyclable (secondary raw materials) to be delivered to a special authorised collection centre.

Plastic materials: recycling permitted where done, disposal in landfill for waste similar to urban waste, incineration allowed in plant equipped with post-combustion and dust damping system before being released into the air.

## ALLGEMEINE VORSCHRIFTEN FÜR EINBAU UND WARTUNG

Der korrekte Einbau des Getriebes in die entsprechende Vorrichtung der Applikation ist Voraussetzung, um einen einwandfreien und dauerhaften Betrieb zu gewährleisten. Vor allem die Oberflächen der Zentrierungen/ Aufnahme sind in einer Toleranz H8 zu fertigen, damit die einwandfreie Übereinstimmung mit der Getriebeachse garantiert wird.

Für die Befestigung sind die Schrauben zu verwenden, die in der Zeichnung/ Teileliste des Modells vorgesehen sind. Dazu sind alle vorgesehenen Befestigungsbohrungen zu verwenden.

Für im Freien betriebene Maschinen wird empfohlen, das Getriebe soweit wie möglich vor Witterungseinflüssen zu schützen sowie mit Rostschutzmittel zu behandeln. Die Dichtringe sind mit wasserabweisendem Fett zu versehen.

Bei Betriebsbedingungen, unter denen Dauerstörungen aufgrund unvorhergesehener Überlastungen auftreten könnten oder gar die Getriebewelle blockiert werden könnte, empfiehlt sich der Einbau eines hydraulischen oder mechanischen Sicherheitssystems zum Schutz des Getriebes.

Der Anbau des Getriebes an Elektro- oder Hydraulikmotoren erfolgt normalerweise direkt über Flansche, wenn keine außergewöhnliche Situation vorliegt, die nach erfolgtem Einbau Schäden verursachen könnte.

Ist es jedoch erforderlich, sehr schwere Motoren anzubauen, deren Gewicht 100 kg überschreitet, wird empfohlen, sich an unseren Kundenservice (sales) zu wenden, um die beste Einbauposition zu ermitteln.

Alternativ dazu kann ein separater Einbau der beiden Teile erfolgen, die dann über Kupplungen oder Riemscheiben verbunden werden.

## ENTSORGUNG DER MASCHINE

Die Entsorgung des bei der Verschrottung der Maschine anfallenden Abfalls muss unter Beachtung der Umweltschutzgesetze erfolgen. Boden, Luft und Wasser dürfen nicht verschmutzt werden. Der anfallende Abfall ist als Sondermüll zu betrachten. Auf jeden Fall müssen die örtlichen Gesetze und Vorschriften zum Schutz der Umwelt des Landes, in dem die Maschine verwendet wird, befolgt werden.

Eisenhaltige Materialien: Da es sich um recyclingfähiges Material handelt (sekundäre Rohstoffe), sind diese einer zugelassenen Rohstoffsammlung zu übergeben.

Kunststoffmaterialien: Recycling zulässig wo möglich, Entsorgung auf der Müllhalde von unter Hausmüll fallendem Abfall, Verbrennung zugelassen in Anlagen mit Nachverbrennung und Entstaubungsanlage vor dem Ablassen in die Atmosphäre.

**REGLES GENERALES D'INSTALLATION  
ET D'ENTRETIEN**

Pour garantir le bon fonctionnement des réducteurs et leur durée de vie maximum, il est indispensable d'assurer un bon accouplement à la structure sur laquelle le groupe doit être fixé. Aussi, les surfaces de cette structure doivent être usinées par des centrages en H8 et de façon à garantir une planéité optimale et une perpendicularité par rapport à l'axe du réducteur.

Pour effectuer la fixation du réducteur, utiliser les boulons indiqués sous chaque dessins des fiches techniques du produit. En outre, utiliser tous les trous de fixation prévus sur les brides des réducteurs.

Pour les groupes installés à ciel ouvert, il est conseillé, dans la mesure du possible, de mettre les réducteurs à l'abri des intempéries, de les traiter avec des produits anti-corrosion et de protéger les joints d'étanchéité à l'aide de la graisse hydrofuge.

Dans le cas des applications exposées à des risques de surcharges accidentelles susceptibles de compromettre la transmission, il est nécessaire de prévoir un dispositif de sécurité (hydraulique ou mécanique) de protection du réducteur.

L'assemblage des réducteurs aux moteurs, principalement électriques ou hydrauliques, est généralement assuré par bridage direct en l'absence de conditions critiques particulières susceptibles d'endommager l'installation.

A cet égard, lorsque s'avère nécessaire l'installation de moteurs très lourds, de plus de 100 kg, il est recommandé de prendre contact avec notre Service Technico-Commercial qui vous aidera à mieux étudier l'application en fonction de la position de montage.

Différemment, il est recommandé d'effectuer un montage séparé des deux éléments et de les relier l'un à l'autre par l'intermédiaire d'un joint ou de poulies.

**DÉMOLITION DE LA MACHINE**

L'élimination des déchets provenant de la démolition de la machine doit s'effectuer dans le respect de l'environnement pour prévenir la pollution des sols, de l'air et des eaux. Les déchets provenant de la démolition de la machine rentrent dans la catégorie des déchets spéciaux. Dans tous les cas, il est nécessaire de veiller au respect des dispositions locales et des autres normes de protection de l'environnement, en conformité aux lois en vigueur dans le pays où la machine est utilisée.

Matériaux ferreux: matériaux recyclables (matières premières secondaires) à remettre à un centre de collecte agréé.

Matières plastiques: recyclage autorisé, élimination en décharge pour déchets assimilables aux déchets urbains, incinération autorisée dans des installations à post-combustion et à système de filtrage des poussières avant rejet dans l'atmosphère.

**NORMAS GENERALES PARA LA  
INSTALACIÓN Y EL MANTENIMIENTO**

Para garantizar un buen funcionamiento de los reductores y una mayor duración se deberá realizar un correcto acoplamiento a la estructura en la que se fija el grupo. Por tanto las superficies de dicha estructura tendrán que estar bien planas y los ejes de los agujeros respetar una tolerancia H8, de este modo se podrá garantizar una óptima planaridad y perpendicularidad con el eje del reductor.

Pour effectuer la fixation du réducteur, utiliser les boulons indiqués sous chaque dessins des fiches techniques du produit. En outre, utiliser tous les trous de fixation prévus sur les brides des réducteurs.

Para los grupos instalados al aire libre se aconseja, donde sea posible, proteger los reductores contra la intemperie, tratarlos con sistemas contra la corrosión y proteger los sellos de lubricación con grasa hidrófuga.

En las aplicaciones donde se pueden producir sobrecargas accidentales, capaces de comprometer la integridad de la transmisión, se deberá utilizar un sistema de seguridad (hidráulico o mecánico) para salvaguardar el reductor.

El montaje entre los reductores y los motores, principalmente eléctricos o hidráulicos, generalmente se realiza con embriado directo siempre que no se presenten particulares condiciones críticas que podrían ocasionar daños después de la instalación.

Para tal fin, donde se requiera la instalación de motores muy pesados (más de 100 Kg), se aconseja ponerse en contacto con nuestro Servicio Técnico-Comercial, para poder evaluar mejor la aplicación en función de la posición de montaje.

Como alternativa, se aconseja un montaje separado de las dos unidades y acoplarlas por medio de juntas o poleas.

**DEMOLICIÓN DE LA MÁQUINA**

Los residuos derivados de la demolición de la máquina deberán eliminarse respetando el medio ambiente, evitando contaminar suelo, aire y agua. Los residuos derivados de la demolición de la máquina se clasifican como residuos especiales. De todos modos, se deberán respetar las legislaciones y normativas locales de protección del medio ambiente observando las leyes vigentes en la materia del país donde se utiliza la máquina.

Materiales ferrosos: se trata de materiales reciclables (materias primas secundarias) que deben enviarse a los correspondientes centros de recolección autorizados.

Materiales plásticos: reciclado permitido si fuere necesario efectuarlo, eliminación en vertederos para residuos assimilables a los urbanos, incineración permitida en instalaciones con post-combustión y sistema de abatimiento de polvo antes de ingresar a la atmósfera.

**NORMAS GERAIS PARA A INSTALAÇÃO  
E MANUTENÇÃO**

Para garantir o bom funcionamento dos reductores e uma maior durabilidade deles, é indispensável assegurar um acoplamento correto na estrutura onde a unidade é fixada. Portanto, as superfícies desta estrutura devem ser usinadas com assentos em tolerância H8 e de maneira a garantir uma perfeita planaridade e perpendicularidade com o eixo do redutor.

Para fijar el redutor hay que utilizar los bulones indicados en los planos de las fichas técnicas del producto. Controlar que se hayan utilizado todos los agujeros de fijación de las bridas.

Para as unidades instaladas ao ar livre aconselha-se, quando possível, proteger os reductores contra os agentes atmosféricos, tratá-los com sistemas anticorrosivos e proteger os retentores de óleo com graxa hidrorrepelente.

Para as aplicações nas quais podem ocorrer sobrecargas accidentais capazes de prejudicar a integridade da transmissão, é preciso instalar um sistema de segurança (hidráulico ou mecânico) para proteger o redutor.

A união entre redutores e motores, sobre todo elétricos ou hidráulicos, é feita normalmente mediante fixação direta por flange quando não existirem condições críticas particulares que possam causar danos após a instalação.

Neste sentido, quando for preciso instalar motores muito pesados, com peso superior a 100 kg, aconselhamos o usuário a entrar em contato com o nosso Serviço Técnico Comercial para avaliar melhor a aplicação em função da posição de montagem.

Como alternativa, aconselha-se a montagem separada das duas unidades ligando-as através de acoplamento ou polias.

**DÉMOLITION DE LA MACHINE**

O descarte dos resíduos derivados da desmontagem da máquina deverá ser realizado no respeito ao meio ambiente, evitando a poluição do solo do ar e da água. Os resíduos derivados da desmontagem da máquina são classificados como resíduos especiais. Em todo caso, deverão ser respeitadas as legislações e normativas locais de protecção do meio ambiente no respeito às leis vigentes no país de utilização da máquina.

Materiais ferrosos: trata-se de materiais recicláveis (materias primas secundárias) que devem ser enviados aos apropriado centros de recolha autorizados.

Materiais plásticos: reciclagem permitida se necessária efectuá-la, descarte em desaguadouro para resíduos semelhantes aos urbanos, incineração permitida em instalações com post-combustão e sistema de abatimento de pó antes da emissão na atmosfera.

**GRUPPI CON FISSAGGIO A FLANGIA  
AVANZATA O SENZA FLANGIA****Riduttori con albero lento maschio (M-P)**

Per tali gruppi, quando i carichi sono superiori del 50% rispetto a quelli indicati nei grafici riportati nelle singole schede di prodotto, si consiglia di utilizzare entrambi i centraggi previsti sulla scatola lato uscita. In tutti i casi, invece, devono essere utilizzati i centraggi previsti sugli alberi scanalati, soprattutto quando vengono montati dei pignoni dentati.

Nelle applicazioni dove si verificano condizioni di forti carichi esterni agenti contemporaneamente sia sull'uscita che sull'entrata, si consiglia di contattare il nostro Servizio Tecnico-Commerciale.

**UNITS WITH FLANGE CLAMPING OR  
WITHOUT FLANGE MOUNTING****Drive with male output shaft t (M-P)**

For these units, when the loads are 50% greater than those indicated on the single product technical sheets, use both spigots on the output housing. In all other cases, especially when toothed pinions are mounted, the spigots on the splined output shafts must be used.

In applications where heavy external load conditions act simultaneously on both the output and the input sides, please contact our Technical-Commercial Service Department.

**EINHEITEN MIT BEFESTIGUNG DURCH  
VORGESCHOBENEN FLANSCH BZW.  
OHNE FLANSCH****Getriebe mit Abtriebswelle (M-P)**

Werden bei Einheiten dieser Art Leistungen angelegt, die die Werte der den jeweiligen Produkten zugeordneten technischen Datenblätter um 50% überschreiten, wird empfohlen, beide Zentrierungen, die am Gehäuse abtriebsseitig vorhanden sind, zu verwenden.

Dagegen gilt grundsätzlich in allen Fällen: vorhandene Zentrierungen an den Nutwellen verwenden, vor allem, wenn Ritzel montiert werden.

Bei Betriebsbedingungen, unter denen starke äußere Belastungen gleichzeitig am Abtrieb und Antrieb wirken, wird empfohlen, sich an unseren Kundenservice zu wenden.

**Riduttori con albero lento femmina (F)****Drives with female output shaft (F)****Getriebe mit innenverzahnter Hohlwelle  
(F)**

Per la tipologia di costruzione questi riduttori sono idonei alla trasmissione della pura coppia.

Occorre quindi curare particolarmente la coassialità e l'ortogonalità nel collegamento con l'albero condotto.

Thanks to their construction design, these drives are particularly suitable for transmitting pure torque.

Therefore always check that the shaft is concentric and in-line with the axis of the driven shaft.

Diese Getriebeausführung kann weder Radial- noch Axialkräfte übertragen.

Es muß deshalb besonders sorgfältig darauf geachtet werden, daß der Anbau an die Hohlwelle koaxial und rechtwinklig erfolgt.

**Riduttori a basamento con piedi (CPC)****Foot mounted drives (CPC)****Getriebe mit Befestigungsfüßen (CPC)**

Anche per questi gruppi occorre che siano verificate le condizioni di fissaggio relative a coassialità ed ortogonalità già elencate all'inizio di questo capitolo.

The fastening conditions with respect to the concentricity and alignment as discussed in the beginning of this section, also apply to these units.

Auch bei diesen Einheiten gelten die zu Beginn des Kapitels erwähnten Vorschriften in Bezug auf einen koaxialen und rechtwinkligen Anbau.

Occorre inoltre controllare adeguatamente l'allineamento del gruppo con la macchina da movimentare. Se si hanno dei dubbi sulla perfetta riuscita di tale operazione, utilizzare un collegamento non rigido fra riduttore e macchina, ad esempio un giunto elastico.

Ensure that the unit is properly aligned with the machine to be operated. Should you have any doubts about the outcome of this operation, connect a flexible coupling between the drive and the machine.

Außerdem muß die Ausrichtung der Einheit mit der zu bewegenden Maschine entsprechend kontrolliert werden. Sollte dieses nicht einwandfrei garantiert werden können, ist zwischen Getriebe und Maschine eine flexible Verbindung einzubauen, z.B. eine elastische Kupplung.

Durante l'installazione considerare che il riduttore così montato non deve essere soggetto a fenomeni di vibrazione.

Ensure that the mounted drive is not subjected to vibrations.

Beim Einbau ist zu beachten, daß das auf diese Weise angebaute Getriebe keinen Vibrations ausgesetzt werden darf.

**GROUPES AVEC FIXATION A BRIDE  
AVANCEE OU SANS BRIDE****Réducteurs à arbre lent mâle (M-P)**

Pour de tels groupes, lorsque les charges sont supérieures de 50% à celles indiquées dans les graphiques des fiches des produits, il est recommandé d'utiliser les deux centrauges prévus sur la carcasse, côté sortie.

Dans tous les cas, il est nécessaire d'utiliser les centrauges prévus sur les arbres cannelés, en particulier quand sont montés des pignons dentés.

Dans le cas des applications présentant de fortes charges extérieures agissant simultanément sur la sortie et sur l'entrée, il est recommandé de prendre contact avec notre Service Technico-Commercial.

**GRUPOS DE FIJACIÓN CON BRIDA  
AVANZADA O SIN BRIDA****Reductores con eje lento macho (M-P)**

Para dichos grupos, cuando las cargas superen en un 50% a los valores indicados en los gráficos de cada una de las fichas del producto, se aconseja la utilización de ambos centrajes previstos en la carcasa, lado salida.

En todos los otros casos, sobretodo cuando se montan los piñones dentados, se tendrán que utilizar los centrajes previstos en los ejes ranurados.

En las aplicaciones con cargas externas pesadas que intervienen simultáneamente en la salida y entrada, se aconseja ponerse en contacto con nuestro Servicio Técnico Comercial.

**UNIDADES COM FIXAÇÃO POR FLANGE  
OU SEM FLANGE****Redutores com eixo lento macho (M-P)**

Para estas unidades, quando as cargas são 50% maiores do que os valores indicados nos gráficos reproduzidos nas fichas de cada produto, aconselha-se a utilização de ambos os assentos existentes na carcaça, no lado da saída.

Em todos os outros casos devem ser utilizadas os assentos existentes nos eixos estriados, principalmente quando forem montados pinhões dentados.

Nas aplicações em que ocorrem condições de fortes cargas externas atuando simultaneamente tanto na saída, como na entrada, aconselha-se a entrar em contato com o nosso Serviço Técnico Comercial.

**Réducteurs à arbre lent femelle (F)**

Le type de construction de ces réducteurs permet de transmettre le couple pur. Il est par conséquent nécessaire de bien veiller à la co-axialité et à l'orthogonalité de l'accouplement avec l'arbre mené.

**Reductores con eje lento hembra (F)**

Debido al tipo de construcción estos reduc-tores son idóneos para transmitir pares puros. Por tanto siempre hay que controlar la coaxialidad y la ortogonalidad del acoplamiento con el eje conducido.

**Redutores com eixo lento fêmea (F)**

Pelo seu tipo construção, estes redutores são adequados para a transmissão de torque puro. É por isso necessário garantir a coaxialidade e a ortogonalidade na ligação com o eixo conduzido.

**Reducteurs a carcasse avec pieds (CPC)**

Pour ces groupes également, il est nécessaire de vérifier les conditions de fixation quant à la co-axialité et l'orthogonalité (voir début du chapitre).

De plus, il est nécessaire contrôler soigneusement l'alignement du groupe avec la machine à actionner.

Au moindre doute quant à la réussite de cette opération, utiliser un accouplement non rigide entre réducteur et machine, par exemple un joint élastique.

Lors de l'installation, ne pas oublier que le réducteur ainsi monté ne doit subir aucun phénomène de vibration.

**Reductores con carcasa con pie (CPC)**

También para estos grupos se tendrán que verificar las condiciones de fijación respecto a la coaxialidad y ortogonalidad que ya fueron enunciadas al comienzo de este capítulo.

Además hay que controlar la alineación del grupo con la máquina a accionar.

Si se tienen dudas sobre el buen resultado de dicha operación, entre el reductor y la máquina hay que utilizar un acoplamiento que no sea rígido, por ejemplo: una junta elástica.

Durante la instalación hay que tener en cuenta que el reductor no esté solicitado con vibraciones.

**Redutores com carcaça munida de pés (CPC).**

Também para estas unidades é preciso verificar as condições de fixação em termos de coaxialidade e ortogonalidade, já citadas no início deste capítulo.

Além disso, é preciso controlar cuidadosamente o alinhamento da unidade com a máquina que deverá ser accionada.

Se tiver dúvidas acerca do resultado desta operação, utilize uma ligação não rígida entre o redutor e a máquina, por exemplo um acoplamento flexível.

Durante a instalação, lembre-se de que o redutor montado desta maneira não deve ficar sujeito a vibrações.

**Riduttori per montaggio pendolare (FS)**

Per l'installazione di questi riduttori si prescrive l'applicazione di un braccio di reazione che rispetti le lunghezze minime riportate a disegno per ogni singolo gruppo.

Inoltre, si consiglia di ammortizzare il vincolo di reazione con elementi in gomma e/o ammortizzatori.

In caso di applicazione di motori molto pesanti o di montaggio con cinghia sul lato entrata, contattare il nostro Servizio Tecnico-Commerciale per verificare l'installazione.

In questi casi si producono, infatti, carichi esterni che, aggiungendosi a quelli della trasmissione, possono ridurre sensibilmente la vita dei cuscinetti, compromettere l'efficacia del serraggio dell'anello calettatore o influire sulla resistenza dell'albero.

Per garantire un efficiente accoppiamento riduttore-utente, occorre sgrassare opportunamente la superficie interna dell'albero del riduttore e il relativo albero maschio di accoppiamento.

Per un corretto serraggio dell'anello calettatore si raccomanda di serrare le viti in modo graduale ed uniforme, con sequenza continua.

Per la rimozione, occorre svitare gradualmente le viti nello stesso modo in cui sono state avvitate, cioè con sequenza continua e graduale.

Si consiglia di far compiere 1/3 di giro ad ogni vite nella prima sequenza di allentamento, in modo da evitare eventuali intraversamenti.

Procedere poi allo sbloccaggio totale, ma sempre gradualmente e senza arrivare all'estrazione totale delle viti dai filetti.

È consigliabile realizzare l'albero maschio da accoppiare ai gruppi Planetary Drives in tolleranza h6.

Seguire, inoltre, le indicazioni riportate a lato di ogni disegno.

**Shaft-mounted drives (FS)**

Before installing these drives, apply a torque arm that respects the minimum lengths shown on the drawing for each single unit.

It is also recommended to cushion the reaction constraint using rubber pieces and/or shock absorbers.

When installing very heavy motors or for a belt mounting on the input side, please contact our Technical-Commercial Service Department.

These external and transmission load conditions might significantly shorten bearing service life, loosening shrink disc tightness or affecting shaft resistance.

To ensure that the drive-driven equipment coupling is as efficient as possible, thoroughly degrease the internal surface of the drive shaft and its male coupling shaft.

Tighten the screws on the shrink disc in a gradual and uniform manner in a continuous sequence.

To remove the unit, gradually loosen the screws in the same order that they were tightened; i.e. in a gradual and continuous sequence.

Each screw should be backed off one third turn during the first loosening sequence to avoid any misalignment.

Then proceed to completely unfasten the unit, always in a gradual manner without completely removing the screw from the threads.

It is recommended to use tolerance h6 for the male shafts to be connected to the Planetary Drives.

In addition, follow the instructions provided next to each drawing.

**Getriebe mit Hohlwelle für Anbau einer Schrumpfscheibe (FS)**

Für den Einbau dieser Getriebe sollte die Achsstrebe die Mindestlänge aufweisen, die in der Zeichnung der jeweiligen Einheit angegeben ist.

Außerdem wird empfohlen, die Achsverbindung mit Gummi- und/oder stoßdämpfenden Elementen abzufedern. Bei besonderen Montagebedingungen, bei denen der Anbau von sehr schweren Motoren vorgesehen ist oder Zugkräfte von außen am Eingang wirken, sollten

Sie sich an unseren Kundenservice (sales) wenden, um den Anbau zu überprüfen. Summieren sich Sonderbelastungen dieser Art und Radialkräfte, kann die Lebensdauer der Lager erheblich eingeschränkt werden sowie die Wirksamkeit der Kupplungsspannung reduziert und die Lebensdauer der Welle beeinflusst werden.

Vor dem Anziehen der Reibschlüsseverbindung wird empfohlen, die Innenfläche der Getriebewelle und die entsprechende Zapfwelle von Fett zu befreien.

Festziehen die Schrauben langsam und gleichmäßig, ohne Unterbrechung, anziehen.

Zum Lösen der Verbindung sind die Schrauben auf dieselbe Weise, gleichmäßig und ohne Unterbrechung zu lösen.

Es wird empfohlen, jede Schraube um eine Drittel-Drehung im ersten Lockerungsvorgang zu lösen, damit eine eventuelle Verschiebung verhindert wird.

Danach die Schrauben vollständig lösen, jedoch immer gleichmäßig und ohne sie aus den Gewinden zu nehmen.

Die an die Planetary Drives anzuschließende Welle sollte eine Toleranz von h6 aufweisen.

Ansonsten sind die Daten in den technischen Zeichnungen zu beachten.

**Réducteur pour montage pendulaire (FS)**

Pour l'installation de ces réducteurs, il est nécessaire d'appliquer un bras de réaction respectant les longueurs minimales indiquées sur le plan de chaque groupe.

En outre, il est conseillé d'amortir le lien de réaction au moyen d'éléments en caoutchouc et/ou d'amortisseurs.

En cas d'application de moteurs très lourds ou de montage avec courroie sur le côté entrée, prendre contact avec notre Service Technico-Commercial pour contrôler l'application.

Dans de tels cas en effet, sont induites des charges externes qui, ajoutées aux charges de transmission, peuvent réduire sensiblement la durée de vie des roulements, compromettre l'efficacité du serrage de la frette ou avoir une influence sur la résistance de l'arbre..

Pour garantir l'efficacité de l'accouplement réducteur-machine, il est nécessaire de dégraisser la surface interne de l'arbre du réducteur ainsi que l'arbre mâle de couplage correspondant.

Pour le bon serrage de la frette, il est recommandé de serrer les vis de manière graduelle et uniforme en séquence continue.

Pour le retrait du réducteur, il est nécessaire de dévisser graduellement les vis comme lors du serrage, c'est-à-dire en séquence continue et graduelle.

Il est conseillé de dévisser de 1/3 de tour chaque vis lors de la première séquence de desserrage, de façon à éviter les éventuelles mises de travers.

Débloquer ensuite les vis totalement, mais toujours graduellement et sans retirer les vis des filetages.

Il est conseillé de réaliser l'arbre mâle à accoupler aux groupes Planetary Drives avec une tolérance h6.

Par ailleurs, il est conseillé de suivre les indications figurant en marge de chaque dessin.

**Reductores para montaje pendular (FS)**

Para la instalación de estos reductores es necesario aplicar un brazo de reacción que respete las longitudes mínimas indicadas en el plano para cada grupo.

Además, se aconseja amortiguar el vínculo de reacción con elementos de goma y/o amortiguadores.

En el caso de aplicaciones de motores muy pesados o de montaje con correa en la entrada, se aconseja ponerse en contacto con nuestro Servicio Técnico-Comercial para verificar la instalación.

En efecto, en estos casos se producen cargas externas que, agregándose a aquellas de la transmisión, pueden reducir sensiblemente la vida útil de los rodamientos y perjudicar la eficacia del ajuste del disco de contracción o influir sobre la resistencia del eje.

Para garantizar un acoplamiento eficiente entre reductor-máquina, hay que desengrasar bien la superficie interna del eje reductor y el respectivo eje macho de acoplamiento.

Para un correcto cierre del disco de contracción se recomienda apretar los tornillos en modo gradual, uniforme y en secuencia continua.

Para la remoción, se deberán aflojar los tornillos del mismo modo que para el ajuste o sea, en secuencia continua y gradual.

Mientras se aflojen los tornillos, se aconseja hacerles dar 1/3 de vuelta a cada uno, de este modo se evitarán eventuales desarlineamientos.

Después efectuar el desbloqueo total, pero siempre gradual y sin extraer totalmente los tornillos de los filetes.

Se aconseja realizar el eje macho, a acoplar con los grupos Planetary Drives, con una tolerancia h6.

Además, se recomienda seguir las instrucciones indicadas al lado de cada plano.

Para a instalação destes redutores prescreve-se a aplicação de um braço de reação que respeite os comprimentos mínimos indicados no desenho para cada unidade.

Além disso, aconselha-se a amortecer o vínculo de reação com elementos de borracha e/ou amortecedores.

No caso de aplicação de motores muito pesados ou de montagem com correia no lado da entrada, entre em contato com o nosso Serviço Técnico Comercial para verificar a instalação.

De fato, nestes casos são produzidas cargas externas que, juntando-se às cargas da transmissão, podem reduzir significativamente a vida dos rolamentos, prejudicar a eficácia de aperto do disco de contração ou ter efeitos negativos na resistência do eixo.

Para garantir um acoplamento eficiente entre o redutor e o equipamento a ser acionado, é preciso remover cuidadosamente toda a graxa da superfície interna do eixo do redutor e do relativo eixo macho de acoplamento.

Para garantir um aperto perfeito do disco de contração, recomendamos apertar os parafusos de maneira gradual e uniforme, com seqüência contínua.

Para a remoção é preciso desatarrar os parafusos gradualmente da mesma maneira como foram atarraxados, ou seja, com seqüência contínua e gradual.

Aconselhamos a desapertar cada parafuso 1/3 de volta na primeira seqüência de afrouxamento para evitar possíveis problemas de alinhamento.

Em seguida, continue desapertando os parafusos sempre gradualmente e sem deixar que eles saiam totalmente das roscas.

É aconselhável realizar o eixo macho a ser acoplado às unidades Planetary Drives com um valor de tolerância h6.

Respeite também as indicações fornecidas ao lado de cada desenho.

**LUBRIFICAZIONE**

Per il buon funzionamento dei riduttori è indispensabile una corretta lubrificazione.

Si consiglia pertanto di verificare le seguenti condizioni in fase di installazione:

- Controllare che, in relazione alla posizione di montaggio specificata in fase d'ordine, il gruppo abbia i tappi di servizio montati correttamente, secondo le indicazioni del capitolo POSIZIONI DI MONTAGGIO (pag. A-58).
- Quando il gruppo è montato in posizione orizzontale bisogna riempirlo fino alla mezzeria, indipendentemente dalla configurazione lineare o angolare. Controllare visivamente il livello dell'olio svitando il tappo posto sulla stessa zona o in zona limitrofa, vale a dire appena sopra.
- Nel caso di gruppi angolari, la coppia conica è collegata in modo che l'olio possa circolare liberamente; conviene comunque effettuare il riempimento a terra, secondo la corretta posizione di montaggio, introducendo olio da entrambe le parti non contemporaneamente, in modo da snellire l'operazione di riempimento e, nello stesso tempo, avere la certezza di introdurre la quantità di olio necessaria, qualora l'olio impieghi tempo per passare da una camera all'altra.
- Rivolgere particolare attenzione ai gruppi montati in posizione verticale che devono essere completamente riempiti mediante gomiti e prolungherie, di cui è dotato il gruppo. Per queste posizioni è consigliabile l'uso di un vaso di espansione fornito su richiesta, separatamente dal gruppo. Il vaso deve essere posizionato oltre il punto più alto del riduttore ed ha il compito di alloggiare eventuali espansioni di olio o di garantire un rabbocco sicuro per gruppi montati in posizioni inaccessibili.
- I freni e gli attacchi motore assemblati formano una camera separata dal resto del riduttore; bisogna pertanto provvedere al loro riempimento separatamente dal riduttore, vedere capitolo FRENI (pag.D-2).
- I gruppi con servizio continuativo sono soggetti a surriscaldamento per la notevole quantità di olio in essi contenuta: in questi casi consigliamo l'uso di oli con una viscosità più bassa.

**LUBRICATION**

Correct lubrication is required to run drives efficiently.

Therefore, check the following conditions during installation:

- Make sure that all plugs are correctly mounted with respect to the installation position specified in the order and according to the instructions in the MOUNTING POSITIONS section (page A-58).
- Fill horizontally-mounted units up to the central line regardless of a linear or angular configuration. To visually check the oil level, unscrew the plug located just above the center line.
- For right angle units, the bevel gear is connected so that the oil is free to circulate. In any case, carry out the filling operation on both ends, but not simultaneously, and while the unit is on the ground, based on the correct mounting position. This will speed up the operation and ensure that the correct quantity of oil is introduced, regardless of how long it would take for the oil to go from one chamber to the other.
- Particular attention should be paid to vertically-mounted units which must be completely filled by means of elbows and extensions supplied with the unit. For these positions it is recommended to use an expansion tank, which can be supplied separately on request. This tank must be positioned above the highest point of the drive and is designed to collect any oil expansions or to ensure that the units mounted in hard-to-reach places can be topped up.
- Brakes and assembled motor connections form a separate chamber from the drive and thus must be filled separately - see the BRAKES section (page D-2).
- Units running under continuous duty conditions may overheat due to the large quantity of oil they contain. In these cases, use oil with a lower viscosity.

**SCHMIERUNG**

Nur eine korrekte Schmierung gewährleistet den problemlosen Betrieb des Getriebes.

Es wird deshalb empfohlen, bei der Installation folgende Bedingungen zu überprüfen:

- Kontrollieren, ob je nach bestellter Montageposition die Einfüllstutzen korrekt montiert sind, vgl. dazu die Angaben im Abschnitt EINBAULAGE (seite A-58).
- Ist das Getriebe waagerecht montiert, muß es bis zur Mitte aufgefüllt werden; Sichtkontrolle des Ölstandes vornehmen, indem der Öleinfüllstopfen abgeschraubt wird.
- Bei Winkelgetrieben ist der rechtwinklige Teil so angebaut, daß das Öl ungehindert zirkulieren kann; es empfiehlt sich jedoch, das Öl am Boden einzufüllen, wobei es auf beiden Seiten geöffnet, aber nicht gleichzeitig eingefüllt wird; der Vorgang wird dadurch beschleunigt und man kann gleichzeitig sicher sein, die erforderliche Ölmenge einzufüllen, da das Öl Zeit braucht, um von einer Kammer in die andere zu fließen.
- Besondere Sorgfalt ist bei Getrieben erforderlich, die senkrecht montiert werden; sie müssen mit Hilfe der beigelegten Kniestücke und Verlängerungen vollständig aufgefüllt werden. Für diese Einbauposition wird die Verwendung eines Ausgleichsbehälter empfohlen, der auf Anfrage separat geliefert wird. Das Gefäß muß oberhalb des höchsten Getriebepunktes positioniert werden und soll überschüssige Ölmengen aufnehmen bzw. bei Getrieben in unzugänglichen Positionen ein sicheres Einfüllen gewährleisten.
- Die montierten Bremsen und Motorschlässe bilden eine vom restlichen Getriebe - ausführung getrennte Kammer; diese muß deshalb getrennt vom Getriebe aufgefüllt werden, siehe Abschnitt BREMSEN (Seite D-2).
- Außerdem kommt es bei Getrieben, die im Dauerbetrieb arbeiten, aufgrund der darin enthaltenen großen Öl Mengen leicht zu Überhitzung; in diesem Fall wird die Verwendung von Öltypen mit niedrigerem Viskositätsgrad empfohlen.

**LUBRIFICATION**

Une bonne lubrification est indispensable au bon fonctionnement des réducteurs.

Il est par conséquent recommandé de s'assurer des conditions suivantes en cours d'installation:

- En fonction de la position de montage spécifiée lors de la commande, s'assurer que les bouchons de service du groupe sont montés correctement, conformément aux indications du chapitre POSITIONS DE MONTAGE (page A-58).
- Lorsque le groupe est monté en position horizontale, il est nécessaire de le remplir de lubrifiant à mi-hauteur, que la configuration soit linéaire ou angulaire. Contrôler le niveau de lubrifiant visuellement en dévissant le bouchon se trouvant à mi-hauteur ou à proximité, c'est-à-dire juste au-dessus.
- Dans le cas de groupes angulaires, la couple conique est relié de façon à ce que le lubrifiant puisse circuler librement; il convient cependant d'effectuer le remplissage au sol, selon la position exacte de montage, en introduisant le lubrifiant des deux côtés, non simultanément, de façon à faciliter le remplissage et, dans le même temps, d'être certain que la quantité d'huile nécessaire a bien été introduite dans le cas où le lubrifiant mettrait un certain temps pour passer d'une chambre à l'autre.
- Faire particulièrement attention aux groupes montés en position verticale, lesquels doivent être entièrement remplis au moyen de coudes et rallonges dont le groupe est équipé. En ce qui concerne ces positions, il est conseillé d'utiliser un réservoir d'expansion fourni sur demande. Le réservoir doit être placé au-dessus du point le plus haut du réducteur, sa fonction est de permettre aux éventuelles expansions du lubrifiant d'y pénétrer ou bien de garantir une remise à niveau dans le cas de groupes montés dans des postions inaccessibles.
- Les freins et les accouplements au moteur forment une chambre séparée du reste du réducteur; il est par conséquent nécessaire de les remplir séparément du réducteur (voir chapitre FREINS, page D-2).
- Les groupes à fonctionnement en service continu sont sujets des surchauffes en raison de la très grande quantité d'huile qu'ils contiennent; dans ce cas, il est conseillé d'employer des lubrifiants à dégré de viscosité inférieur.

**LUBRICACIÓN**

Para un buen funcionamiento de los reducers es indispensable una correcta lubricación.

Por tanto, se aconseja verificar las siguientes condiciones durante la instalación:

- Controlar que, según la posición de montaje especificada en la orden, el grupo tenga todos los tapones de servicio correctamente montados, según las indicaciones del capítulo POSICIONES DE MONTAJE (Pág. A-58).
- Cuando el grupo esté montado en posición horizontal habrá que llenarlo hasta la línea central, independientemente de la configuración lineal o angular. Controlar visualmente el nivel de aceite aflojando el tapón que está situado en la misma zona o en una zona limítrofe o sea, apenas por encima.
- En el caso de grupos angulares, los engranajes cónicos están conectados de modo tal que el aceite pueda circular libremente; se aconseja introducir el aceite en ambos lados pero no simultáneamente y mientras la unidad esté en el piso, según la correcta posición de montaje. De este modo se hará más rápido el llenado y, al mismo tiempo, se podrá estar seguro que se introdujo la cantidad necesaria de aceite, ya que el aceite emplea un cierto tiempo para pasar de una cámara a otra.
- Prestar una particular atención a los grupos montados en posición vertical pues se tienen que llenar totalmente con tubos acodados y extensiones suministradas junto con el grupo. Para estas posiciones se aconseja utilizar un recipiente de expansión suministrado a pedido, separado del grupo. Dicho recipiente tiene que ubicarse por encima del punto más alto del reducтор и cumple la función de absorber las eventuales dilataciones del aceite o de garantizar un llenado seguro en los grupos que se montaron en posiciones inaccesibles.
- Los frenos y las conexiones al motor forman una cámara separada del resto del reducтор; por tanto hay que prever su llenado separadamente del reducтор, ver el capítulo FRENOS (Pág. D-2).
- Los grupos con servicio continuo pueden recalentarse debido a la gran cantidad de aceite que contienen: en estos casos se aconseja utilizar aceites con una viscosidad más baja.

**LUBRIFICAÇÃO**

Para obter o bom funcionamento dos reducers, é indispensável proceder a uma lubrificação correta.

Aconselhamos, portanto, a verificar as seguintes condições no momento da instalação:

- Em função da posição de montagem especificada na encomenda, verifique se todos os bujões de serviço estão montados corretamente na unidade, segundo as indicações do capítulo POSIÇÕES DE MONTAGEM (pág. A-58).
- Se a unidade estiver montada na posição horizontal, é preciso enchê-la até a linha central, independentemente da configuração linear ou angular. Controle o nível de óleo visualmente desatarra-xando o bujão posto na mesma zona ou numa zona limítrofe, ou seja, imediatamente acima da linha central.
- No caso de unidades angulares, o par cônico é ligado de maneira que o óleo possa circular livremente; de qualquer forma, é conveniente fazer o enchimento no chão, de acordo com a posição de montagem correta, introduzindo o óleo por ambos os lados não simultaneamente para agilizar a operação de enchimento e, ao mesmo tempo, ter a certeza de introduzir a quantidade de óleo necessária, se o mesmo demorar um certo tempo para passar de uma câmara à outra.
- Preste muita atenção nas unidades montadas em posição vertical porque elas devem ser enchidas completamente utilizando os cotovelos e extensões fornecidos com a unidade. Para estas posições é aconselhável utilizar um vaso de expansão fornecido separadamente da unidade, a pedido. O vaso de expansão deve ser colocado acima do ponto mais alto do redutor e serve para receber possíveis expansões de óleo ou para garantir um abastecimento seguro para unidades montadas em posições inacessíveis.
- Os freios e as conexões montadas no motor formam uma câmara separada do resto do redutor; portanto, é preciso encher-los separadamente do redutor. Consulte o capítulo FREIOS (pág. D-2).
- As unidades com serviço contínuo ficam sujeitas a superaquecimento devido à grande quantidade de óleo nelas contidas; nestes casos, aconselhamos o emprego de óleos com uma viscosidade mais baixa.

I quantitativi di olio indicati nelle tabelle di catalogo, riportate per ogni grandezza, sono puramente indicativi e sono soggetti a variazioni in funzione della configurazione del riduttore: tipo di rapporto, freno, attacco motore e supporto in uscita.

Durante il funzionamento la temperatura delle superfici esterne non deve superare gli 80°C.

Se si verificano temperature superiori contattare il Servizio Tecnico-Commerciale Comer Industries.

#### CAMBIO OLIO

- Effettuare il primo cambio olio dopo 100 ore di funzionamento.
- I cambi successivi devono avvenire dopo 2000 ore o almeno una volta all'anno.
- Lo svuotamento del riduttore va effettuato con l'olio ancora caldo, per evitare il deposito di morchie.
- Pulire i tappi.
- Prima del riempimento con nuovo olio effettuare un lavaggio interno del gruppo con liquido detergente consigliato dal fornitore di lubrificante.
- Controllare periodicamente che non vi siano perdite d'olio e che, a gruppo fermo, l'olio raggiunga il livello previsto. Se necessario, effettuare un rabbocco con lo stesso tipo di olio presente nel riduttore.
- **Attenzione:**  
un rabbocco superiore al 10% del quantitativo totale può essere indice di perdita nel riduttore.

#### SMALTIMENTO OLIO ESAUSTO

Durante le fasi di smaltimento degli oli esausti è obbligatorio utilizzare tutte le cautele e le professionalità necessarie per eseguire il lavoro a regola d'arte, evitando di inquinare suolo, aria, acqua e rispettando l'ambiente e la salute umana.

L'olio esausto, non inquinato da altre sostanze, deve essere raccolto e conferito in apposito centro autorizzato, nel pieno rispetto delle locali legislazioni e normative di tutela ambientale e delle leggi vigenti.

Please note that the oil quantities shown in the catalogue are approximate and may vary depending on the drive configuration: ratio, brake, motor connections and output adapters.

During normal operation, the temperature of the outer casing should not exceed 80°C.

If the temperature exceeds 80°C, contact the Comer Industries Technical-Commercial Service Department.

#### OIL CHANGES

- The first oil change should be done after 100 hours of duty
- Subsequent oil changes should take place after 2000 hours or at least once a year.
- To avoid sludge deposits, change the oil while the drive is still hot.
- Clean all plugs.
- Before adding the new oil, the unit should be flushed with a liquid detergent recommended by the lubricant supplier.
- Periodically check for oil leaks and the oil level while the unit is idling. If needed, top up using the same type of oil.
- **Attention:**  
if the quantity of oil used to top up is greater than 10% of the oil capacity, then check again for leaks.

#### DISPOSING OF EXHAUSTED OIL

When disposing of exhausted oils, it is mandatory to adopt all precautions and professional expertise necessary for carrying out the job in a workmanlike manner so as not to pollute the soil, air and water and treating the environment and human health with care.

Exhausted oil not contaminated by other substances must be collected and delivered to a special authorised centre, in full compliance with local environmental protection laws and regulations and laws in force.

Die in den Tabellen den einzelnen Größen zugeordneten Ölmengen sind Richtwerte, die je nach Getriebeausführung und damit je nach Übersetzung, Bremse, Motoranschluß und Ausgangswelle variieren.

Beim Betrieb sollte die Gehäuseterminatur von außen 80°C nicht überschreiten.

Sollten höhere Temperaturen auftreten, wenden Sie sich bitte an den Kundenservice (sales) von SOM.

#### ÖLWECHSEL

- Der erste Ölwechsel sollte nach 100 Betriebstunden vorgenommen werden.
- Weitere Ölwechsel sollten nach 2000 Betriebsstunden bzw. mindestens einmal jährlich erfolgen.
- Das Öl bitte bei noch warmen Getriebe ablassen. Auf diese Weise werden Ablagerungen vermieden.
- Ölstopfen reinigen.
- Vor dem Auffüllen mit neuem Öl, das Getriebe innen mit einem vom Schmierstoffhersteller empfohlenen Reinigungsmittel auswaschen.
- Getriebe regelmäßig auf Dichtigkeit prüfen sowie sicherstellen, daß bei Stillstand das Öl bis zum vorgesehenen Ölstand reicht. Sofern erforderlich, ist Öl nachzufüllen; der Öltyp muß mit dem im Getriebe bereits enthaltenen Öl unbedingt übereinstimmen.
- **Achtung:**  
Eine Nachfüllmenge, die 10% der Gesamtmenge übersteigt, könnte auf eine Undichtigkeit des Getriebes hinweisen.

#### ALTÖLENTSORGUNG

Bei den Vorgängen zur Altölentsorgung ist es vorgeschrieben, alle notwendigen Sicherheitsmaßnahmen zu treffen und die Arbeit kunstgerecht durchzuführen, damit Boden, Luft und Wasser nicht verschmutzt und die Umwelt und die Gesundheit des Menschen geschützt werden.

Nicht mit anderen Stoffen verunreinigtes Altöl muss unter Berücksichtigung der örtlichen Umweltschutzgesetze und -vorschriften gesammelt und der speziellen zugelassenen Entsorgungsstelle übergeben werden.

Les quantités d'huile indiquées dans les tableaux du catalogue pour chaque dimensionnement sont purement indicatives et peuvent varier en fonction de la configuration du réducteur: type de rapport, frein, accouplement au moteur et support en sortie.

Pendant le fonctionnement du réducteur, la température de ses surfaces extérieures ne doit pas dépasser 80°C.

En présence de températures supérieures, prendre contact avec le Service Technico-Commercial Comer Industries.

Las cantidades de aceite indicadas en las tablas del catálogo para cada dimensión, son sólo indicativas y pueden variar en función de la configuración del reductor: tipo de relación, freno, conexión al motor y soporte de salida.

Durante el funcionamiento la temperatura de las superficies externas no tiene que superar los 80°C.

Si las temperaturas fueran superiores será necesario ponerse en contacto con el Servicio Técnico-Comercial de Comer Industries.

As quantidades de óleo apresentadas nas tabelas do catálogo, fornecidas para cada tamanho, são puramente indicativas e podem variar em função da configuração do reductor: tipo de relação, freio, acoplamento com o motor e suporte na saída.

Durante o funcionamento, a temperatura das superfícies externas não deve ultrapassar 80°C.

No caso de temperaturas superiores, entre em contato com o Serviço Técnico Comercial da Comer Industries.

## VIDANGE D'HUILE

- Faire la première vidange après 100 heures de fonctionnement.
- Exécuter les vidanges suivantes toutes les 2000 heures ou bien au moins une fois par an.
- La vidange du réducteur doit se faire lorsque l'huile est encore chaude de façon à éviter les dépôts de cambouis.
- Nettoyer les bouchons.
- Laver l'intérieur du réducteur avec un détergent conseillé par le fournisseur du lubrifiant avant d'effectuer le remplissage.
- Contrôler périodiquement qu'il n'y ait pas de pertes d'huile et que, lorsque le groupe est arrêté, l'huile atteigne bien le niveau prévu.  
Si nécessaire, rétablir ce niveau avec de l'huile du même type que celle se trouvant dans le réducteur.
- Attention:**  
une remise à niveau avec plus de 10% de la quantité totale de l'huile contenue dans le réducteur peut être un signe de fuite dans ce dernier.

## CAMBIO DE ACEITE

- Efectuar el primer cambio de aceite después de las 100 horas de funcionamiento.
  - Los cambios sucesivos se deberán realizar después de las 2000 horas o por lo menos una vez al año.
  - El vaciado del reductor se tiene que realizar estando todavía el aceite caliente, para evitar el depósito de sedimentos.
  - Limpiar los tapones.
  - Antes de efectuar el llenado con el aceite nuevo hay que lavar el interior del grupo con el detergente que aconseja el proveedor del lubricante.
  - Controlar periódicamente que no haya pérdidas de aceite y que, estando el grupo parado, el aceite alcance el nivel previsto.  
Si fuese necesario, efectuar un llenado con el mismo tipo de aceite del reductor.
- Atención:**  
si el llenado supera el 10% de la cantidad total puede ser que haya una pérdida en el reductor.

## TROCA DO ÓLEO

- Faça a primeira troca de óleo após 100 horas de funcionamento.
- As trocas seguintes devem ser feitas após 2000 horas ou pelo menos uma vez por ano.
- Esvazie o reductor com o óleo ainda quente para evitar o depósito de borra.
- Limpe todos os bujões.
- Antes de encher com óleo novo, faça uma lavagem interna da unidade com um líquido detergente aconselhado pelo fornecedor do lubrificante.
- Verifique periodicamente se não há vazamentos de óleo e se, com a unidade parada, o óleo atinge o nível previsto.  
Se necessário, complete o nível com o mesmo tipo de óleo presente no reductor.

**Atenção:**  
a necessidade de completar o nível com uma quantidade maior do que 10% da quantidade total pode ser um sintoma de vazamento de óleo no reductor.

## ÉLIMINATION DES HUILES USÉES

Durant les phases d'élimination des huiles usées, il est impératif de prendre toutes les précautions et les mesures techniques pour opérer dans les règles de l'art et prévenir ainsi la pollution des sols, de l'air et des eaux, pour respecter l'environnement et la santé des personnes.

Les huiles usées, non polluées par d'autres substances, doivent être récupérées et remises à un centre de collecte agréé, dans le respect des dispositions locales et des autres normes de protection de l'environnement, en conformité aux lois en vigueur.

## ELIMINACIÓN DE ACEITE USADO

Durante las fases de eliminación de los aceites usados se requiere ser extremadamente cauteloso y profesional para efectuar correctamente el trabajo, evitando contaminar suelo, aire, agua y respetando el medio ambiente y la salud humana.

El aceite usado, no contaminado con otras sustancias, debe recolectarse y enviarse al centro autorizado correspondiente, respetando las legislaciones y normativas locales de protección del ambiente y leyes vigentes.

## DESCARTE DO ÓLEO EXAURIDO

Durante as fases de descarte dos óleos exauridos é obrigatório ter toda a cautela e profissionalismo necessário para realizar o trabalho de acordo à norma, evitando poluir o solo, ar, água e respeitando o meio ambiente e a saúde humana.

O óleo exaurido, não contaminado por outras substâncias, deve ser recolhido e enviado ao centro autorizado, no pleno respeito das legislações e normativas locais de protecção do meio ambiente e das leis vigentes.

## Lubrificante

Comer Industries consiglia l'uso di olii per ingranaggi con additivi EP e caratteristiche antischiuma. Quando il riduttore è sottoposto ad elevate temperature, si consiglia l'uso di olii a base sintetica.

A tale riguardo le Tabelle N°4 e N°5 riporta alcuni tipi di olii commerciali che rispondono alle caratteristiche richieste in funzione della temperatura ambiente.

Contattare il nostro servizio tecnico commerciale per richiedere informazioni relative a:

- lubrificanti presenti in tabella
- lubrificanti non presenti in tabella
- lubrificanti per uso alimentare
- lubrificanti biologici
- installazioni con temperature ambientali estreme
- viscosità/temperature non in tabella

## Lubricant

Comer Industries recommends using EP additive oil with anti-foaming properties. If the drive is subjected to high temperatures, use synthetic oil.

With this in mind, Table 4 and Table 5 shows some types of commercially available oils that meet the lubrication requirements in relation to different ambient temperatures.

Contact our technical-commercial service for more information about:

- the lubricants in the table
- the lubricants not in the table
- food-grade lubricants
- biological lubricants
- installations with extreme ambient temperatures
- viscosity/temperatures not in the table

## Schmierstoff

Comer Industries empfiehlt Getriebeöltypen mit EP- Zusatz und Anti-schaum-Eigenschaft. Ist das Getriebe starken Temperaturschwankungen ausgesetzt, wird die Verwendung von synthetischen Öltypen.

Dazu sind in Tabelle N° 4, N° 5 einige im Handel erhältliche Öltypen aufgeführt, deren Eigenschaften unterschiedlichen Raumtemperaturen angepaßt sind.

Für folgende Informationen bitte unseren technischen/kommerziellen Service kontaktieren:

- In der Tabelle aufgeführte Schmiermittel
- In der Tabelle nicht aufgeführte Schmiermittel
- Schmiermittel im Lebensmittelbereich
- Biologisch abbaubare Schmiermittel
- Anlagen mit extremen Umgebungstemperaturen
- In der Tabelle nicht aufgeführte Viskositäten/Temperaturen

## Lubrifiant

Comer Industries conseille l'utilisation des huiles pour engrenages avec additifs EP et anti-mousse. Lorsque le réducteur est soumis à de hautes températures, il est conseillé d'utiliser des huiles de synthèse.

Le tableau N°4, N°5 indique certains types d'huiles vendues dans le commerce qui correspondent aux caractéristiques requises, en fonction de la température ambiante.

Contacter notre service technique commercial pour demander des informations au sujet de :

- lubrifiants présents dans le tableau
- lubrifiants non présents dans le tableau
- lubrifiants à usage dans le secteur alimentaire
- lubrifiants biologiques
- installations avec des températures ambiantes extrêmes
- viscosités/températures non indiquées dans le tableau

## Lubricante

Comer Industries aconseja el uso de aceites para engranajes con aditivos EP con características antiespuma. Cuando el reductor está sometido a elevadas temperaturas, se aconseja el uso de aceites de base sintética.

Para tal fin en la Tabla N° 4, N° 5 se indican algunos tipos de aceites comerciales que cumplen con las características solicitadas en función de la temperatura ambiente.

Contactar con nuestro servicio técnico comercial para solicitar información relativa a:

- lubricantes presentes en la tabla
- lubricantes no presentes en la tabla
- lubricantes para uso alimentario
- lubricantes biológicos
- instalaciones con temperaturas ambientales extremas
- viscosidad/temperaturas no presentes en la tabla

## Lubrificante

A Comer Industries aconselha o uso de óleos para engrenagens com aditivos EP e características antiespuma. Quando o redutor for submetido a temperaturas elevadas, aconselha-se o emprego de óleo sintético.

Para o efeito, na Tabela N° 4, N° 5 indicamos alguns tipos de óleos comerciais que apresentam as características exigidas em função da temperatura ambiente.

Contactar o nosso serviço técnico comercial para pedir informações relativas a:

- lubrificantes presentes na tabela
- lubrificantes não presentes na tabela
- lubrificantes para uso alimentar
- lubrificantes biológicos
- instalações com temperaturas ambientais muito elevadas
- viscosidade/temperaturas não na tabela

In generale, i riduttori Planetary Drives vengono forniti privi di lubrificante

Les réducteurs Planetary Drives sont généralement vendus sans lubrifiant.

Generally, Planetary Drives are supplied without lubricant.

En general, los reductores Planetary Drives se suministran sin el lubricante.

HINWEIS: saemtliche Getriebe Planetary Drives werden ohne Oelfullung ausgeliefert.

Em geral, os redutores Planetary Drives são fornecidos sem lubrificante.

N.B. Les quantités sont indicatives et doivent être contrôlées en phase de remplissage en vérifiant le niveau par le biais du bouchon de service.

Nota. Las cantidades de lubricante indicadas son aconsejables y se recomienda controlarlas durante el llenado verificando el nivel mediante los respectivos tapones de servicio.

OBS.: as quantidades de lubrificante apresentadas são indicativas e devem ser averiguadas no momento do abastecimento controlando o nível por meio do bujão de serviço correspondente.

**Vaso di espansione**

Per applicazioni dove vengono considerate posizioni di montaggio verticali si consiglia l'utilizzo di un vaso di espansione che permette di alloggiare eventuali espansioni di olio o di garantire un rabbocco in posizioni inaccessibili. Tale accessorio può essere fornito su richiesta.

**Expansion tank**

For vertical applications, it is recommended to use an expansion tank that can absorb any oil expansions and/or ensure topping up in hard-to-reach places. This fitting can be supplied on request.

**Ausgleichsbehälter**

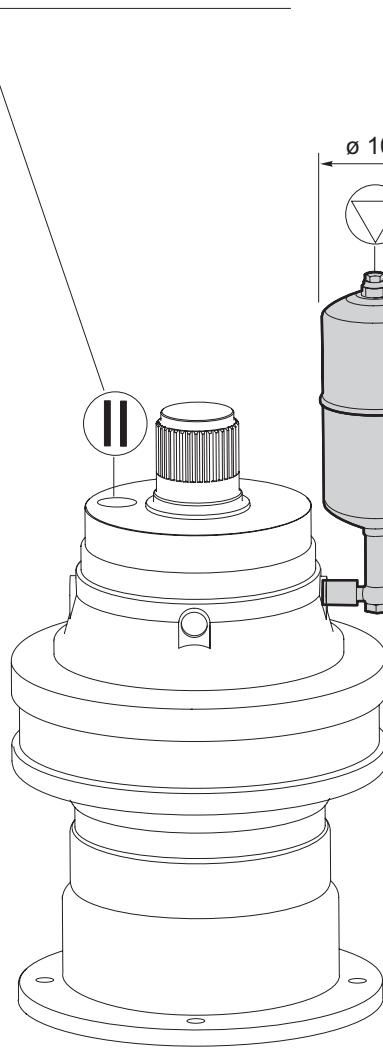

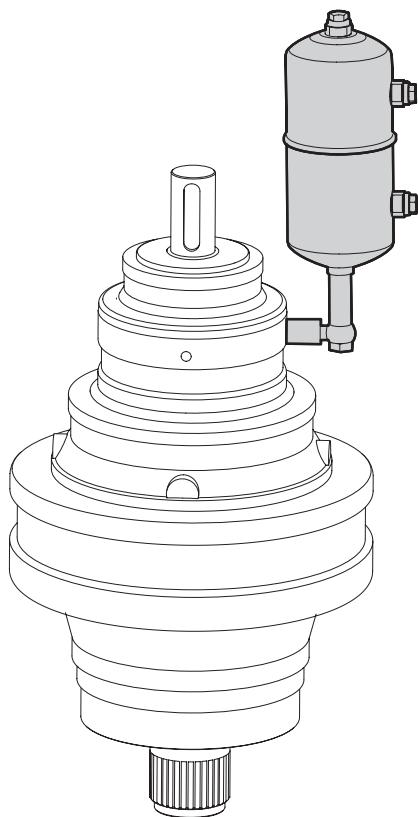

Fuer die vertikalen Einbaupositionen ist die Ausrustung mit einem Oelausgleichsbehälter zu empfehlen. Dadurch ist gegeben, dass eventuelle Ölüberritte vermieden und eine einfache Befüllung ermöglicht wird. Der Behälter ist auf Nachfrage lieferbar.

**Vase d'expansion**

Pour les applications prévoyant des positions de montage verticales, il est recommandé d'utiliser un vase d'expansion qui permet une éventuelle expansion de l'huile ou qui garantit un remplissage dans des positions inaccessibles.

Cet accessoire peut être fourni sur demande.

**Recipiente de expansión**

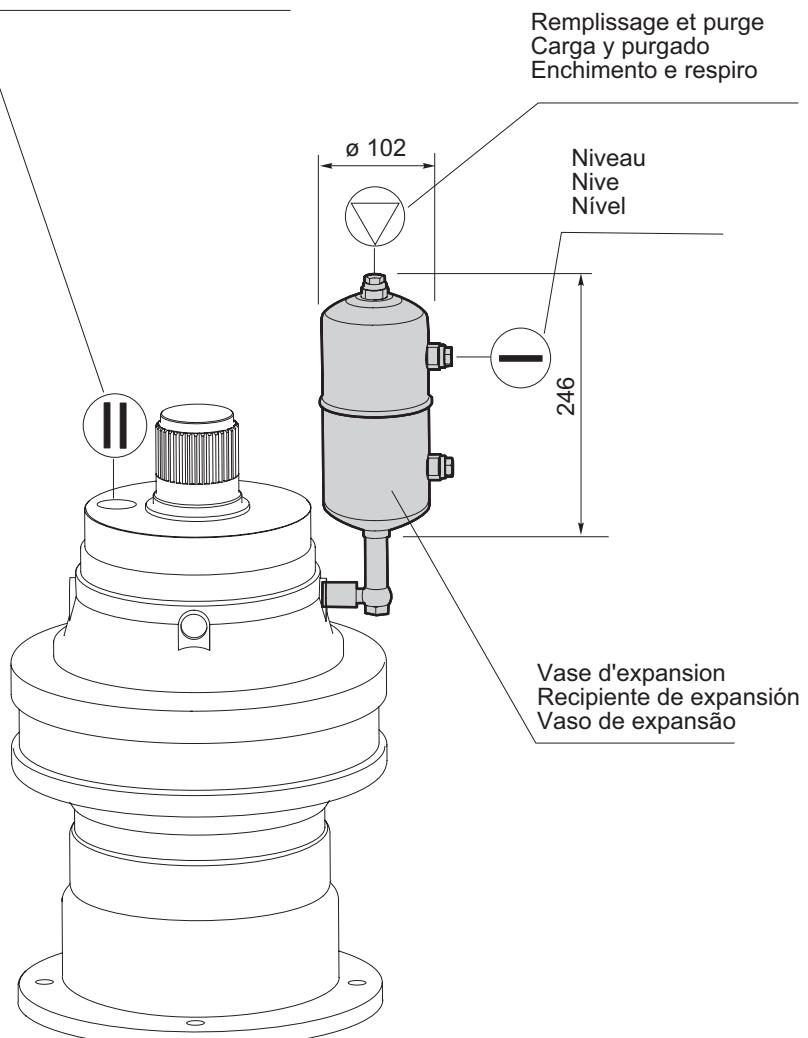

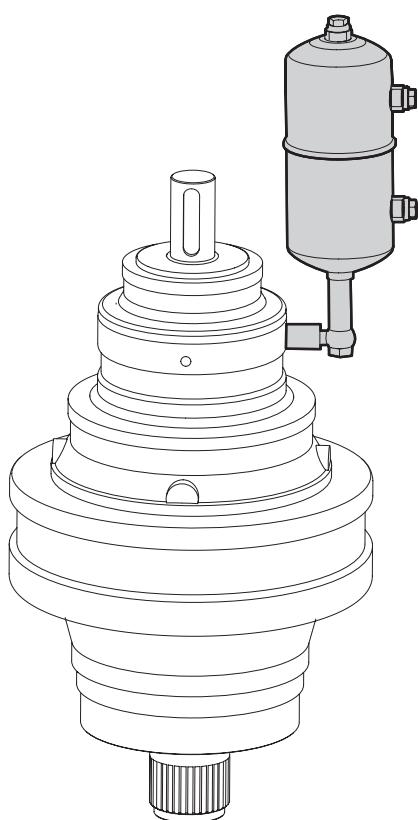

Para las aplicaciones donde se prevén posiciones verticales de montaje, se aconseja la utilización de un recipiente de expansión que permita absorber las eventuales dilataciones del aceite y/o garantizar un llenado en posiciones inaccesibles.  
Dicho accesorio se puede suministrar a pedido.

**Vase d'expansion**

Para aplicações com posições de montagem verticais, aconselha-se a utilização de um vaso de expansão que serve para receber possíveis expansões de óleo ou garantir o abastecimento em posições inacessíveis.

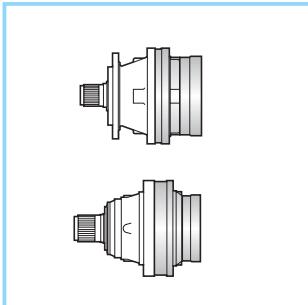

Este acessório pode ser fornecido a pedido.

N.B.  
L'orientamento della foratura della flangia di fissaggio è come illustrato nelle schede dei dati dimensionali dei riduttori.

The mounting flange orientation is shown in each planetary gears technical sheets.

Die Ausfuehrung der Befestigungsvorrichtung (Flansch, Bohrung) ist in den Datenblättern der Getriebe ersichtlich.

L'orientation de la flasque de montage est indiquée dans chaque fiche technique réducteur.

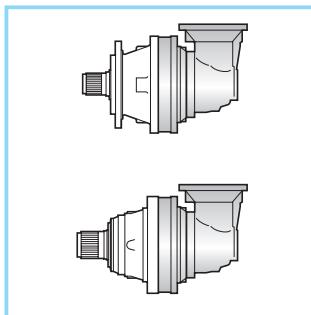

La orientación del perforado de la brida de fijación se ilustra en las fichas de los datos dimensionales de los reductores.

A orientação da furação do flange de fixação é a ilustrada nas fichas de dados técnicos dimensionais dos redutores.

Le pagine che seguono riportano i dati tecnici prestazionali e dimensionali dei riduttori Serie PG-PGA.

Per facilitare la ricerca della grandezza desiderata riportiamo la tabella sopraindicata con i dati indicativi e i riferimenti alle pagine.

The following pages show the technical information on performances and dimensions of the PG-PGA planetary the research and the selection of the required size you can refer to the above table, including some technical data and the corresponding page.

Die folgenden Seiten zeigen die technischen Daten bezüglich Leistung und Dimensionen der Produktserien PG-PGA. Um die Suche der gewünschten Groesse zu erleichtern, liefert die vorstehende Tabelle die Groessen in Verbindung zur entsprechenden Kata- logseite.

Les pages qui suivent se rapportent aux données techniques des prestations et dimensions des réducteurs série PG-PGA. Pour faciliter la sélection de la taille du réducteur envisagée, se référer au tableau ci-dessus pour se reporter à la page correspondante.

Las páginas siguientes contienen los datos técnicos de las prestaciones y dimensiones de la serie de reductores PG-PGA. Para facilitar la búsqueda de la dimensión deseada se puede consultar la siguiente tabla, con los datos indicativos y las páginas correspondientes.

As páginas seguintes mostram os dados técnicos de desempenho e as características dimensionais dos redutores da Série PG-PGA. Para facilitar a procura do tamanho desejado, reproduzimos a tabela a seguir com os dados indicativos e as referências às páginas.

DATI TECNICI / TECHNICAL DATA / TECHNISCHE DATEN  
DONNEES TECHNIQUES / DATOS TÉCNICOS / DADOS TÉCNICOS

ENTRATE / GEARBOX INPUTS / ANTRIEB / ENTREES / ENTRADAS / ENTRADAS

Queste pagine riportano le dimensioni di massimo ingombro del riduttore nelle varie configurazioni disponibili e i tipi di entrate, freni e motorizzazioni applicabili con l'indicazione delle pagine nelle quali reperire ulteriori dati. Il massimo ingombro del riduttore è ottenuto (come illustrato nei disegni seguenti) sommando alle quote A e B le dimensioni delle entrate utilizzate (L, P, Z) e le eventuali maggiorazioni dimensionali dove indicate.

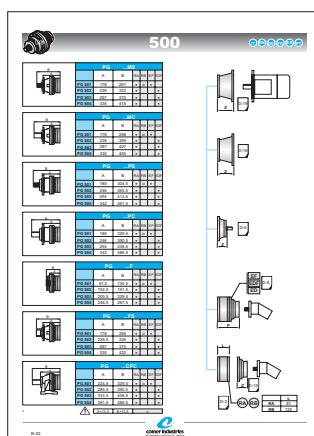

These pages show overall dimensions of the gearbox in their possible configurations plus the type of gearbox inputs, brakes and motor drives applicable with indication of the pages in which to find further information. Maximum gearbox overall dimension is obtained (see scheme below) adding the input dimensions used (L, P, Z) to a and b dimensions, plus possible oversize if indicated.

Diese Seiten geben die Aussenmasse der diversen Getriebetypen an. Dazu werden die moeglichen Optionen der verfuegbaren Antriebsformen, Bremsen gezeigt und auf die entsprechenden Katalogseiten hingewiesen. Das Gesamtausmass des Getriebes wird ermittelt (wie im nachstehenden Schema gezeigt), indem die Angaben aus dem vorgenannten Abtriebsausmass A und B, das Laengenmass des gewaehlten Antriebs (L, P, Z) und eventuellen Aufmasse (wenn angezeigt) addiert werden.

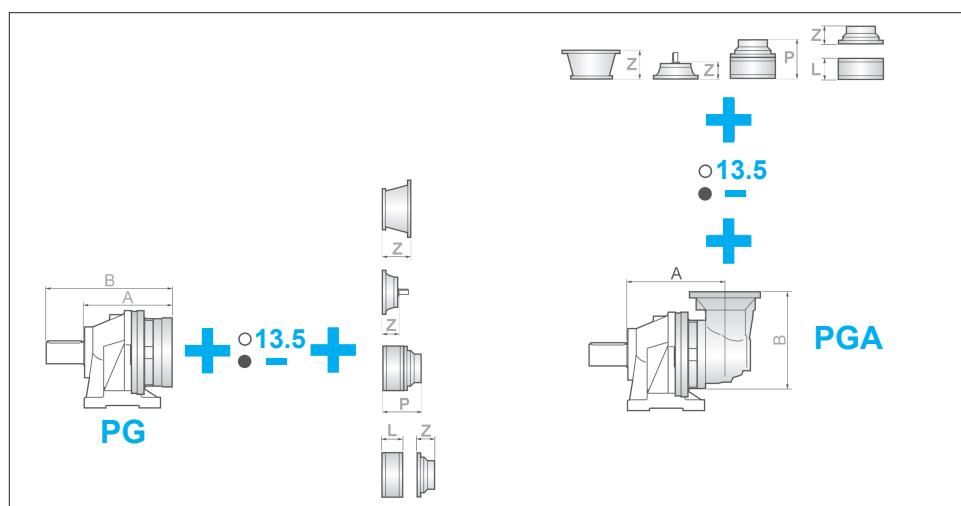

Ces pages montrent les dimensions extérieures des réducteurs dans leurs configurations possibles ainsi que les sortes d'entrées, freins et d'adaptations moteurs applicables avec les indications des pages dans lesquelles se trouvent de plus amples informations. La dimension extérieure maximum du réducteur est obtenue (voir schéma ci-dessous) en additionnant les dimensions des entrées utilisées (L, P, Z) aux dimensions A et B, plus la cote additionnelle si indiquée.

Estas páginas contienen las dimensiones exteriores máximas del reducotor para las configuraciones disponibles y los tipos de entradas, frenos y motores conductores aplicables con la indicación de las páginas en las que se pueden obtener más informaciones. Las dimensiones máximas del reducotor se obtienen (como se ilustra en los siguientes esquemas) sumando a las cotas A y B las dimensiones de las entradas utilizadas (L, P, Z) y los eventuales incrementos dimensionales donde esté indicado.

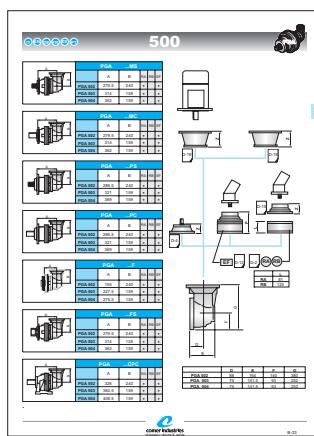

Estas páginas fornecem as dimensões máximas do redutor nas várias configurações disponíveis e os tipos de entradas, freios e acionamentos aplicáveis, com a indicação das páginas onde encontrar outros dados. Obtém-se as dimensões máximas do redutor (conforme ilustrado nos desenhos seguintes) somando as dimensões das entradas utilizadas (L, P, Z) mais as cotas adicionais, se indicadas, às medidas A e B.

7

8

9

I simboli (•) riportati nelle tabelle indicano l'applicabilità dei freni (RA, RB) e delle entrate ED,EDF,EF.  
I simboli (o) indicano ugualmente l'applicabilità degli stessi componenti prevedendo una maggiorazione di lunghezza (come evidenziato nello schema sopra riportato).

The tables, show the suitability of the brakes (RA and RB) and of the inputs ED, EDF, EF.Symbols marked with (o) in the tables, also show the suitability of the same components increasing the length (as shown in the scheme above).

Das Symbol (•) in der Tabelle gibt an, welcher Bremsentyp (RA, RB) und welche Form der Antriebsvorrichtung ED, EDF oder EF verwendet werden kann. Das Symbol (o) hat dieselbe Funktion. Zusätzlich wird auf ein zu berücksichtigendes Aufmass hingewiesen (siehe oberes Schéma).

Les symboles marqués d'un (•) dans les tableaux, montrent l'adaptation des freins (RA et RB) et des entrées ED,EDF,EF. Les symboles marqués d'un (o) dans les tableaux, montrent également l'adaptation des mêmes composants en augmentant la longueur (comme montré dans le schéma ci-dessous).

Los símbolos (•) contenidos en las tablas indican la factibilidad de aplicación de los frenos (RA , RB) y de las entradas ED,EDF,EF .Los símbolos (o) también indican la factibilidad de aplicación de los mismos componentes incrementando la longitud (como se evidencia en el esquema arriba indicado).

Os símbolos (•) presentes nas tabelas indicam a aplicabilidade dos freios (RA, RB) e das entradas ED, EDF, EF. Os símbolos (o) indicam igualmente a aplicabilidade dos mesmos componentes prevendo um aumento de comprimento (conforme mostrado no esquema acima).

### ACCESSORI USCITA OUTPUT ACCESSORIES ABTRIEBSBAUTEILE ACCESOIRES DE SORTIE ACCESORIOS DE SALIDA ACESSÓRIOS DE SAÍDA

Questa pagina riporta le dimensioni degli accessori disponibili.

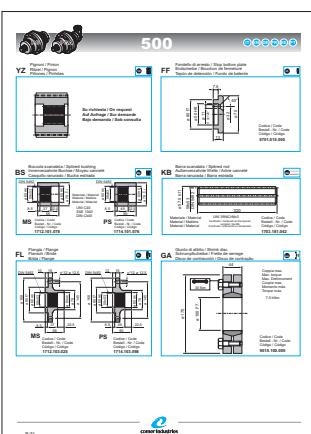

This page shows dimensions of the available accessories.

Diese Seite gibt die Dimensionsmasse der verfügbaren Abtriebsbauteile an.

Cette page montre les dimensions des accessoires disponibles.

Esta página contiene las dimensiones de los accesorios disponibles.

Esta página fornece as dimensões dos acessórios disponíveis.

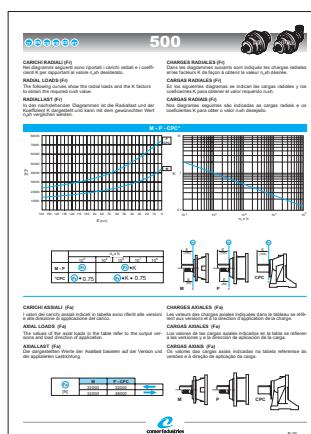

### CARICHI RADIALI E ASSIALI RADIAL AND AXIAL LOADS RADIALLAST UND AXIALLAST CHARGES RADIALES ET AXIALES CARGAS RADIALES Y AXIALES CARGAS RADIÁIS E AXIAIS

Questa pagina riporta i diagrammi dai quali si ricavano i carichi radiali sugli alberi in uscita e le tabelle con i valori dei carichi assiali.

This page shows graphs to determine radial loads on output shafts and tables for axial load values.

Diese Seite zeigt die Diagramme, aus denen die Werte der Radiallast auf An- oder Abtriebswelle ermittelt werden können. Dazu sind hier die Tabellen mit den Werten der Axiallast ersichtlich.

Cette page montre les diagrammes des charges radiales sur les arbres de sortie et les tableaux avec les valeurs des charges axiales.

## CARICHI RADIALI (Fr)

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

### RADIAL LOADS (Fr)

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

### RADIAL LOAD (Fr)

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

## CHARGES RADIALES (Fr)

Dans les diagrammes suivants sont indiquées les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

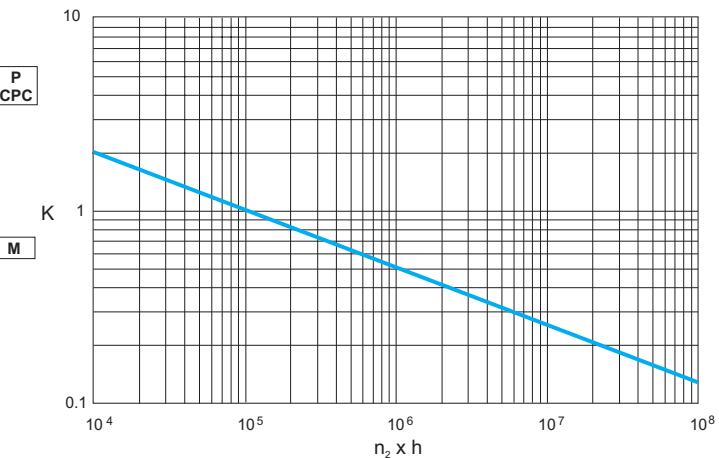

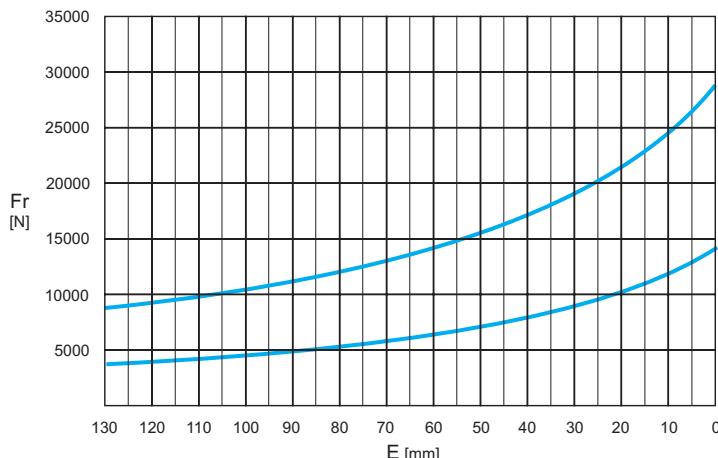

### CARGAS RADIALES (Fr)

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

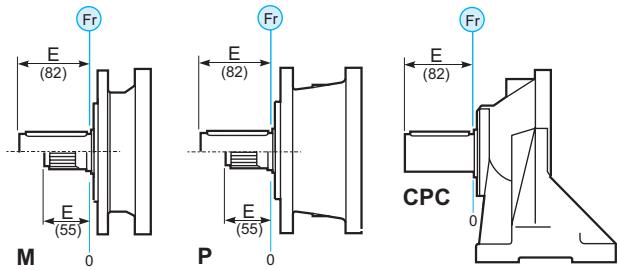

### CARGAS RADIAIS (Fr)

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor  $n_2 \times h$  desejado.

## CARICHI ASSIALI (Fa)

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

### AXIAL LOADS (Fa)

The values of the axial loads in the table refer to the output versions and load direction of application.

### AXIAL LOAD (Fa)

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

## CHARGES AXIALES (Fa)

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

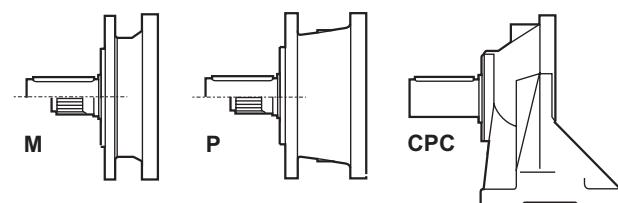

### CARGAS AXIALES (Fa)

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

### CARGAS AXIAIS (Fa)

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

## CARICHI RADIALI (Fr)

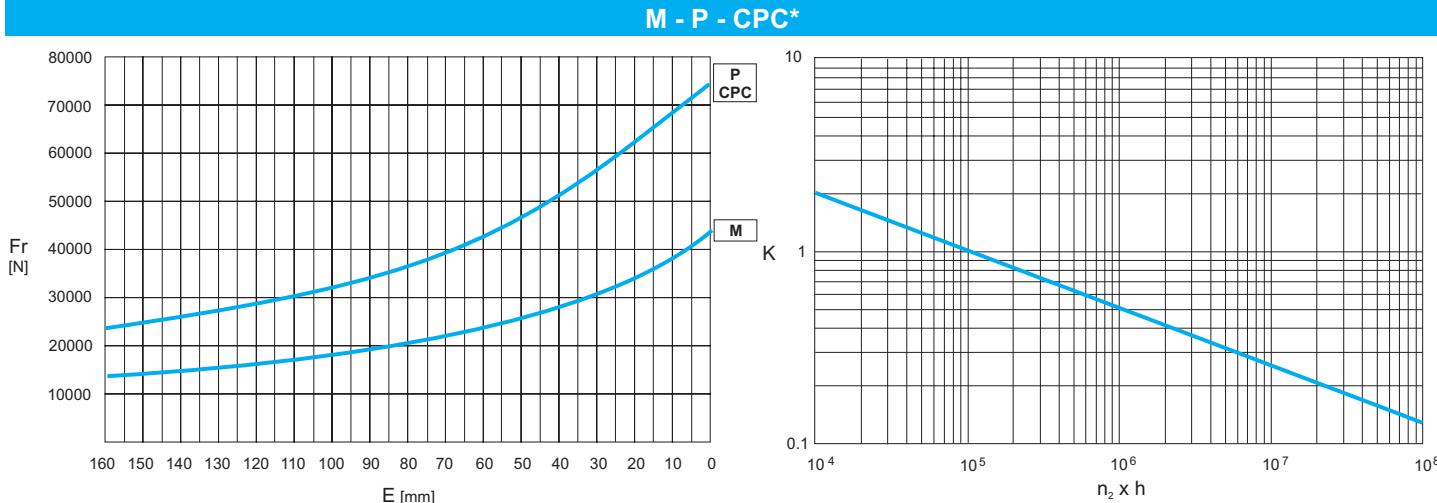

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

### RADIAL LOADS (Fr)

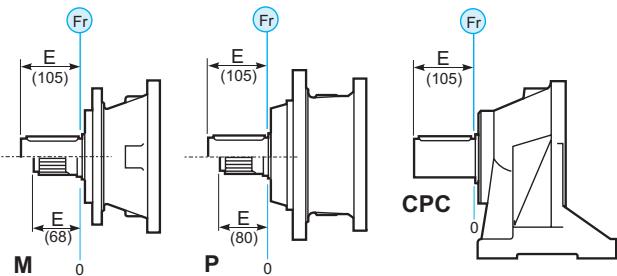

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

### RADIALLAST (Fr)

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

	$n_2 \times h$				
	$10^5$	$10^4$	$10^6$	$10^7$	$10^8$

## CARICHI ASSIALI (Fa)

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

### AXIAL LOADS (Fa)

The values of the axial loads in the table refer to the output versions and load direction of application.

### AXIALLAST (Fa)

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

	32000	48000	→ ←

## CHARGES RADIALES (Fr)

Dans les diagrammes suivants sont indiqués les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

### CARGAS RADIALES (Fr)

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

### CARGAS RADIAIS (Fr)

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

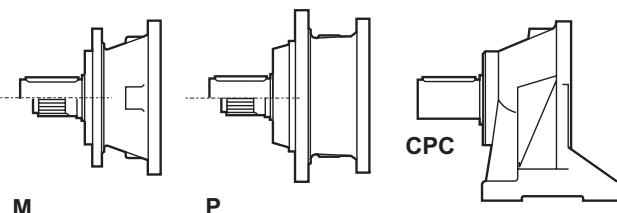

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

### CARGAS AXIALES (Fa)

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

### CARGAS AXIAIS (Fa)

Os valores das cargas axiais indicadas na tabela referemse às versões e à direção de aplicação da carga.

**CARICHI RADIALI (Fr)**

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

**RADIAL LOADS (Fr)**

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

**RADIALLAST (Fr)**

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

**CHARGES RADIALES (Fr)**

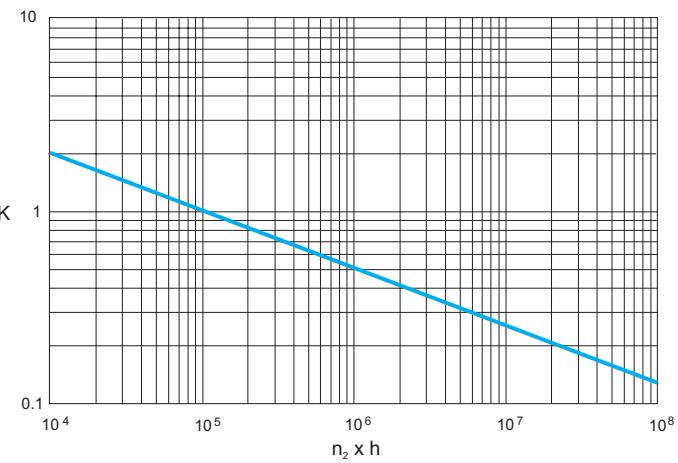

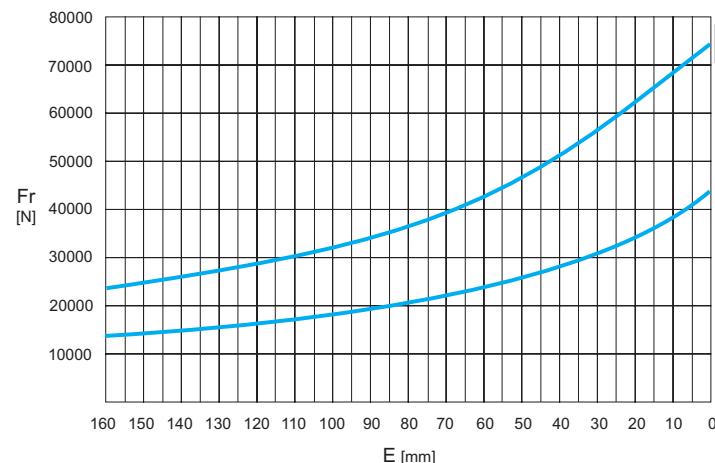

Dans les diagrammes suivants sont indiqués les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

**CARGAS RADIALES (Fr)**

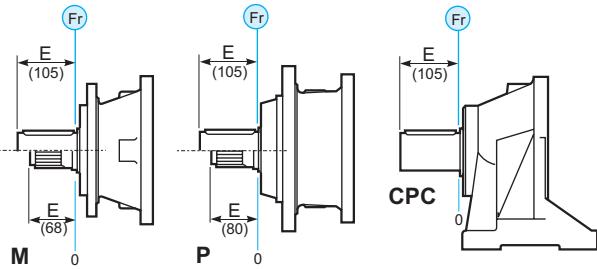

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

**CARGAS RADIAIS (Fr)**

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

**CARICHI ASSIALI (Fa)**

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

**AXIAL LOADS (Fa)**

The values of the axial loads in the table refer to the output versions and load direction of application.

**AXIALLAST (Fa)**

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

**CHARGES AXIALES (Fa)**

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

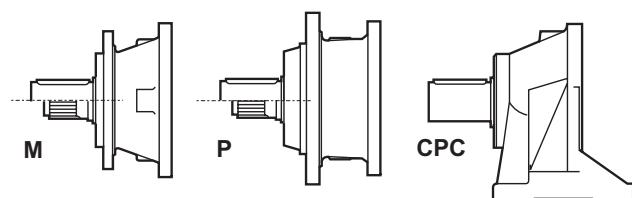

**CARGAS AXIALES (Fa)**

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

**CARGAS AXIAIS (Fa)**

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

## CARICHI RADIALI (Fr)

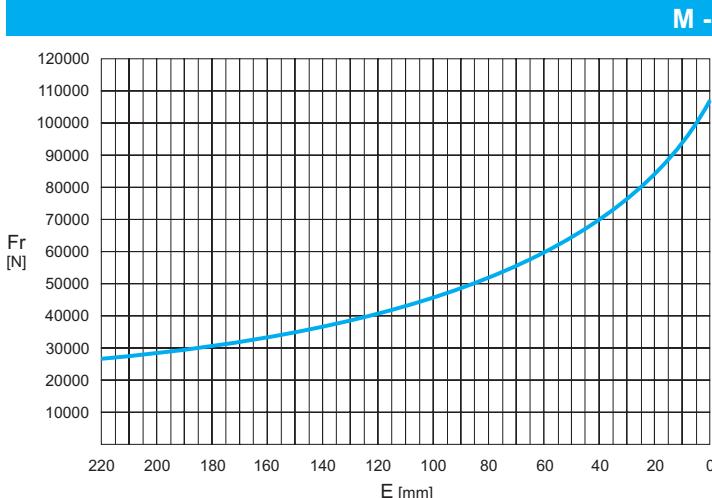

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

## RADIAL LOADS (Fr)

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

## RADIALLAST (Fr)

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

## CHARGES RADIALES (Fr)

Dans les diagrammes suivants sont indiqués les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

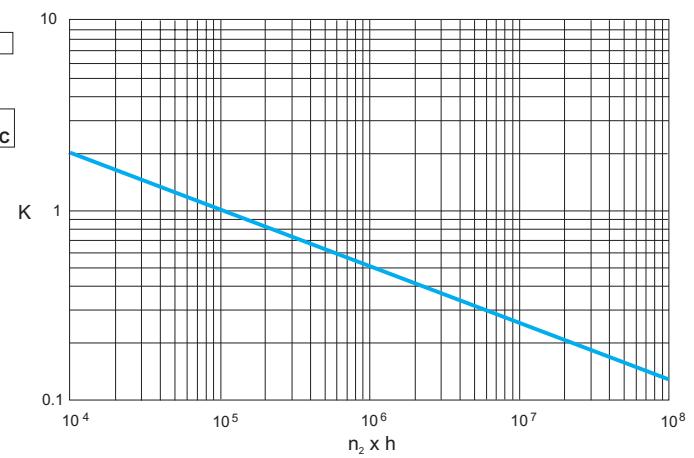

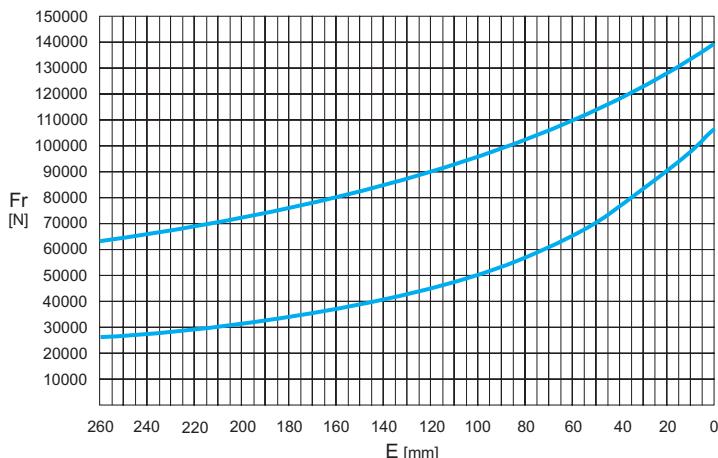

## CARGAS RADIALES (Fr)

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

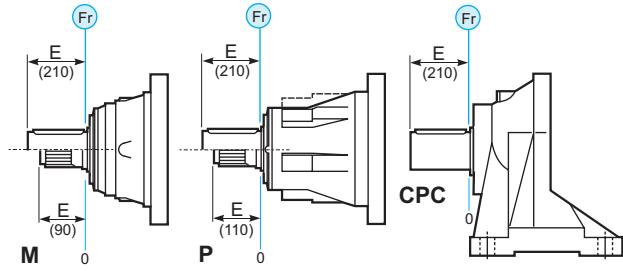

## CARGAS RADIAIS (Fr)

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

## CARICHI ASSIALI (Fa)

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

## AXIAL LOADS (Fa)

The values of the axial loads in the table refer to the output versions and load direction of application.

## AXIALLAST (Fa)

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

## CHARGES AXIALES (Fa)

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

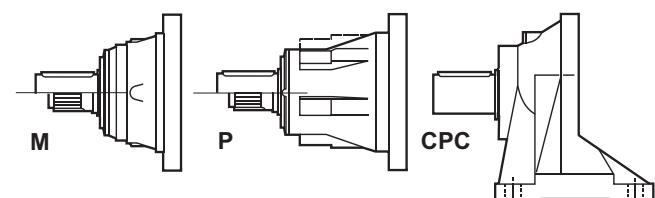

## CARGAS AXIALES (Fa)

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

## CARGAS AXIAIS (Fa)

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

**CARICHI RADIALI (Fr)**

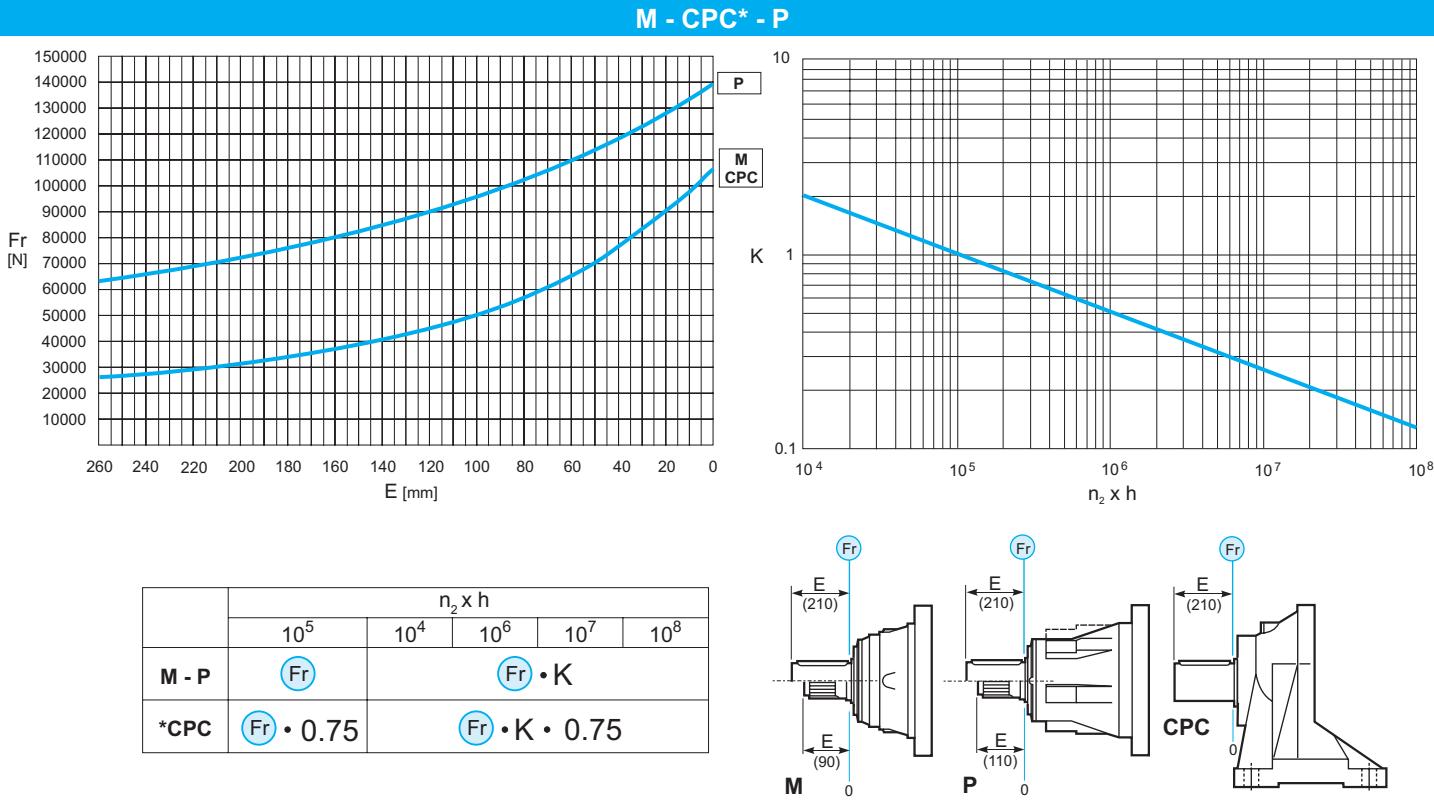

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

**RADIAL LOADS (Fr)**

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

**RADIALLAST (Fr)**

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

**CARICHI ASSIALI (Fa)**

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

**AXIAL LOADS (Fa)**

The values of the axial loads in the table refer to the output versions and load direction of application.

**AXIALLAST (Fa)**

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

## CARICHI RADIALI (Fr)

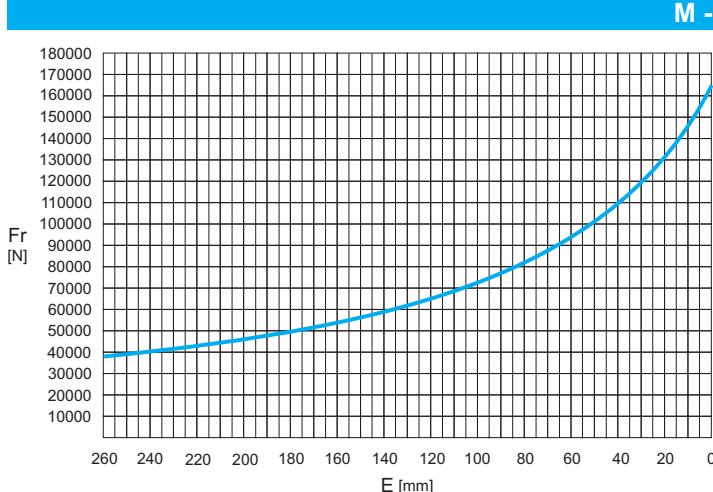

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

### RADIAL LOADS (Fr)

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

### RADIALLAST (Fr)

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

## CHARGES RADIALES (Fr)

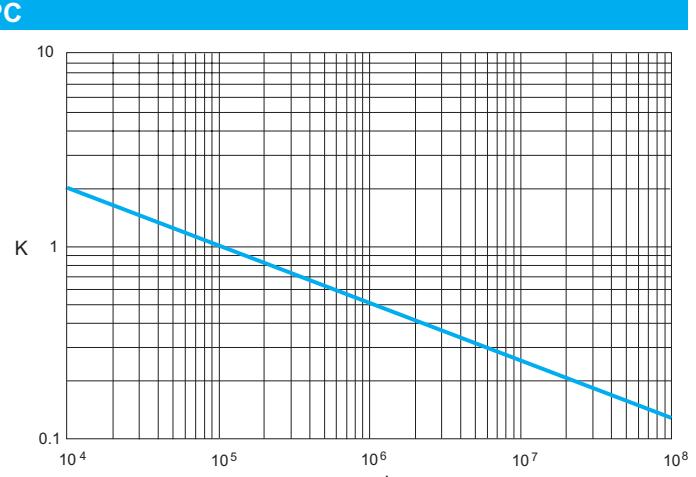

Dans les diagrammes suivants sont indiquées les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

### CARGAS RADIALES (Fr)

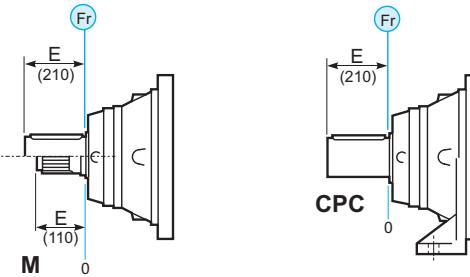

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

### CARGAS RADIAIS (Fr)

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

	$n_2 \times h$				
	$10^5$	$10^4$	$10^6$	$10^7$	$10^8$

## CARICHI ASSIALI (Fa)

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

### AXIAL LOADS (Fa)

The values of the axial loads in the table refer to the output versions and load direction of application.

### AXIALLAST (Fa)

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

Fa	M	CPC

## CHARGES AXIALES (Fa)

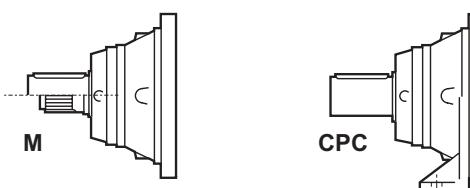

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

### CARGAS AXIALES (Fa)

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

### CARGAS AXIAIS (Fa)

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

**CARICHI RADIALI (Fr)**

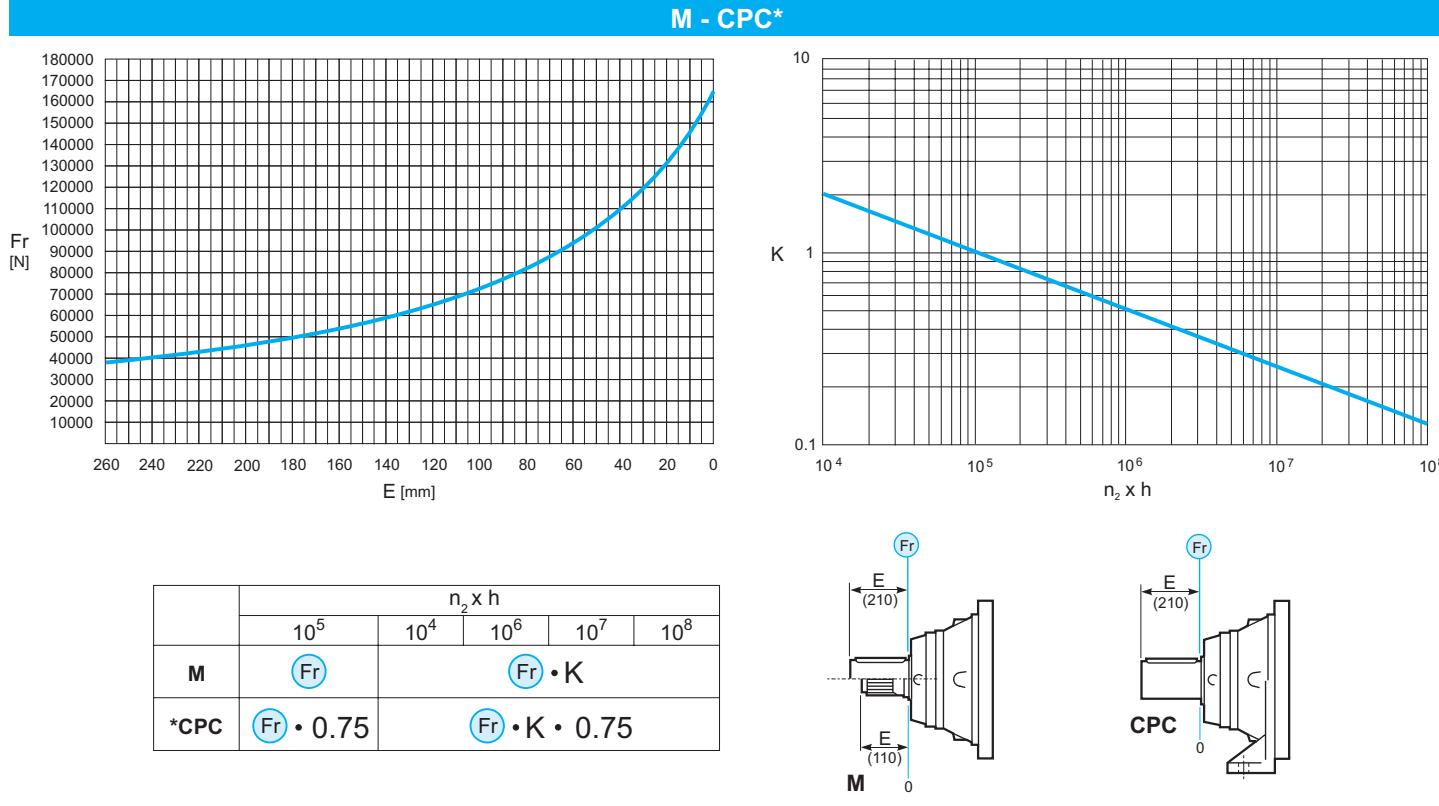

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

**RADIAL LOADS (Fr)**

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

**RADIALLAST (Fr)**

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

**CHARGES RADIALES (Fr)**

Dans les diagrammes suivants sont indiquées les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

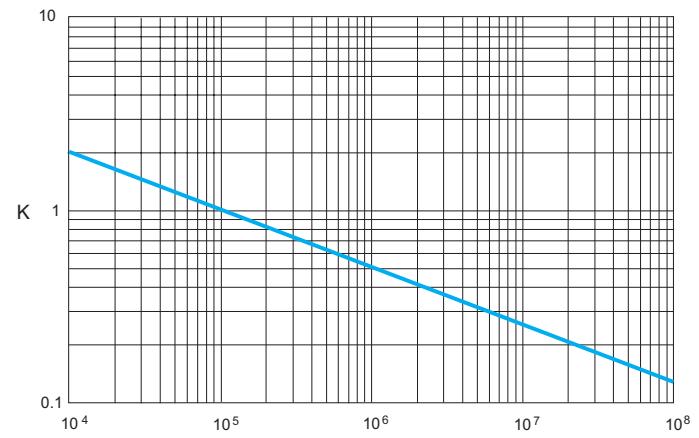

**CARGAS RADIALES (Fr)**

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

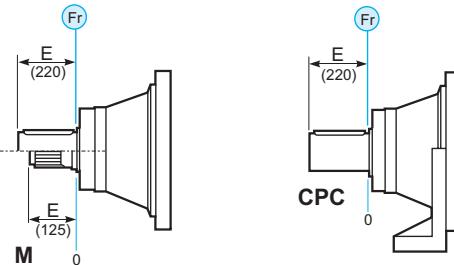

**CARGAS RADIAIS (Fr)**

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

**CARICHI ASSIALI (Fa)**

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

**AXIAL LOADS (Fa)**

The values of the axial loads in the table refer to the output versions and load direction of application.

**AXIALLAST (Fa)**

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

Le pagine che seguono riportano i dati tecnici prestazionali e dimensionali dei riduttori Serie PG-PGA.

Per facilitare la ricerca della grandezza desiderata riportiamo la tabella sopraindicata con i dati indicativi e i riferimenti alle pagine.

The following pages show the technical information on performances and dimensions of the PG-PGA planetary the research and the selection of the required size you can refer to the above table, including some technical data and the corresponding page.

Die folgenden Seiten zeigen die technischen Daten bezüglich Leistung und Dimensionen der Produktserien PG-PGA. Um die Suche der gewünschten Größe zu erleichtern, liefert die vorstehende Tabelle die Größen in Verbindung zur entsprechenden Kata- logseite.

Les pages qui suivent se rapportent aux données techniques des prestations et dimensions des réducteurs série PG-PGA. Pour faciliter la sélection de la taille du réducteur envisagée, se référer au tableau ci-dessus pour se reporter à la page correspondante.

Las páginas siguientes contienen los datos técnicos de las prestaciones y dimensiones de la serie de reductores PG-PGA. Para facilitar la búsqueda de la dimensión deseada se puede consultar la siguiente tabla, con los datos indicativos y las páginas correspondientes.

As páginas seguintes mostram os dados técnicos de desempenho e as características dimensionais dos redutores da Série PG-PGA. Para facilitar a procura do tamanho desejado, reproduzimos a tabela a seguir com os dados indicativos e as referências às páginas.

La coppia massima indicata è valida solo con calettatori forniti da Planetary Drives  
The maximum torque indicated is valid only with shrink discs supplied by Planetary Drives  
Das dargestellte, maximale Drehmoment gilt nur mit von Planetary Drives gelieferter Schrumpfscheibe  
Le couple maximal indiqué n'est valable qu'avec les frettés de serrage fournis par Planetary Drives  
El momento máximo indicado sólo es válido con discos de contracción suministrados por Planetary Drives  
O torque máximo indicado é válido exclusivamente com discos de contração fornecidos pela Planetary Drives

## CARICHI RADIALI (Fr)

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

## RADIAL LOADS (Fr)

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

## RADIALLAST (Fr)

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

## CHARGES RADIALES (Fr)

Dans les diagrammes suivants sont indiqués les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

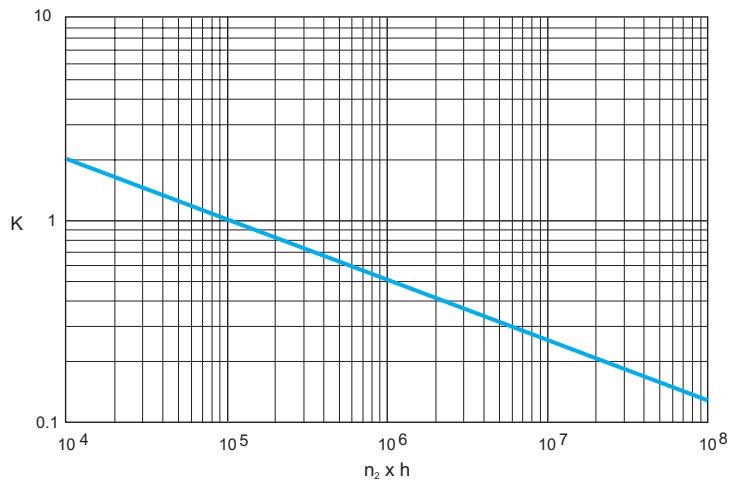

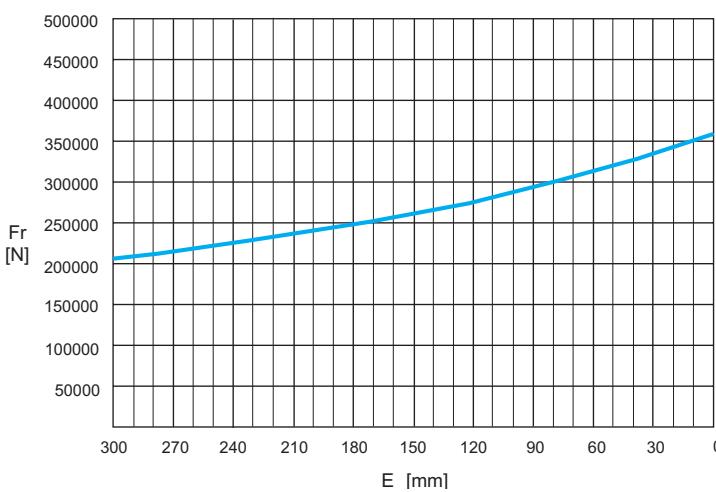

## CARGAS RADIALES (Fr)

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

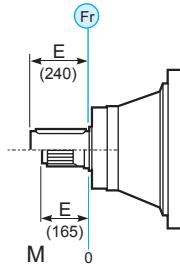

## CARGAS RADIAIS (Fr)

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor  $n_2 \times h$  desejado.

## CARICHI ASSIALI (Fa)

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

## AXIAL LOADS (Fa)

The values of the axial loads in the table refer to the output versions and load direction of application.

## AXIALLAST (Fa)

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

## CHARGES AXIALES (Fa)

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

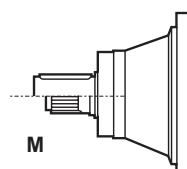

## CARGAS AXIALES (Fa)

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

## CARGAS AXIAIS (Fa)

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

**CARICHI RADIALI (Fr)**

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

**RADIAL LOADS (Fr)**

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

**RADIALLAST (Fr)**

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

**CHARGES RADIALES (Fr)**

Dans les diagrammes suivants sont indiqués les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

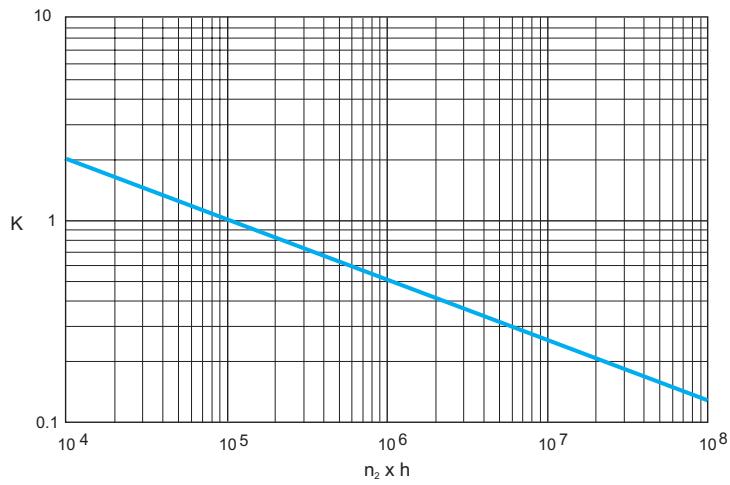

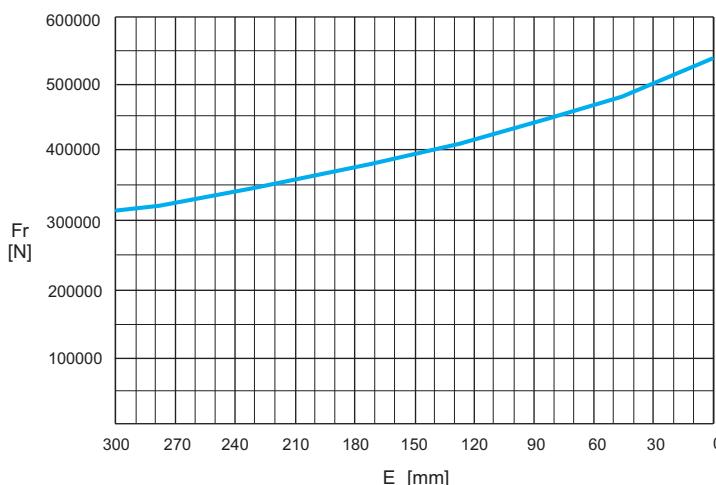

**CARGAS RADIALES (Fr)**

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

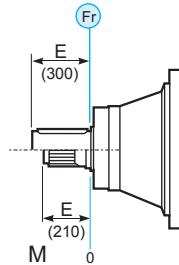

**CARGAS RADIAIS (Fr)**

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

**CARICHI ASSIALI (Fa)**

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

**AXIAL LOADS (Fa)**

The values of the axial loads in the table refer to the output versions and load direction of application.

**AXIALLAST (Fa)**

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

Fa	M
[N]	113600 ←
[N]	113600 →

**CHARGES AXIALES (Fa)**

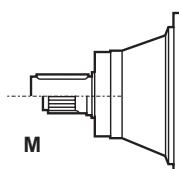

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

**CARGAS AXIALES (Fa)**

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

**CARGAS AXIAIS (Fa)**

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

**CARICHI RADIALI (Fr)**

Nei diagrammi seguenti sono riportati i carichi radiali e i coefficienti K per rapportarli al valore  $n_2 \times h$  desiderato.

**RADIAL LOADS (Fr)**

The following curves show the radial loads and the K factors to obtain the required  $n_2 \times h$  value.

**RADIALLAST (Fr)**

In den nachstehenden Diagrammen ist die Radiallast und der Koeffizient K dargestellt und kann mit dem gewünschten Wert  $n_2 \times h$  verglichen werden.

**CHARGES RADIALES (Fr)**

Dans les diagrammes suivants sont indiquées les charges radiales et les facteurs K de façon à obtenir la valeur  $n_2 \times h$  désirée.

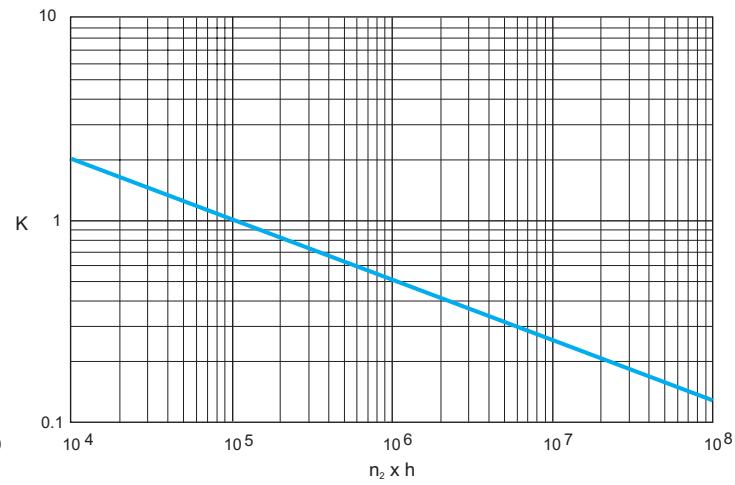

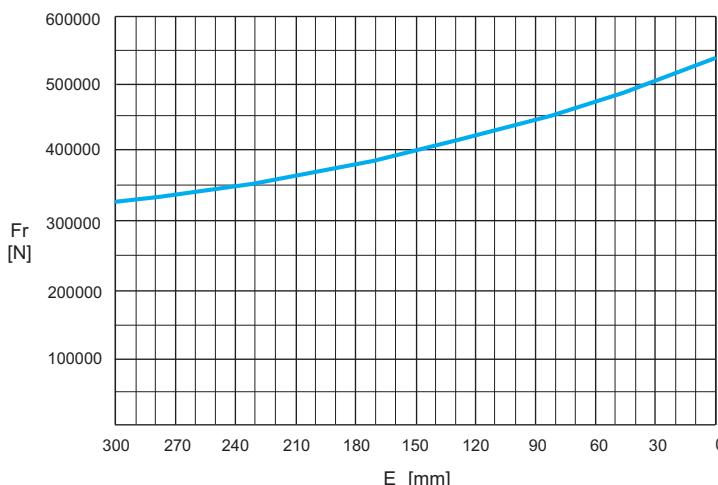

**CARGAS RADIALES (Fr)**

En los siguientes diagramas se indican las cargas radiales y los coeficientes K para obtener el valor requerido  $n_2 \times h$ .

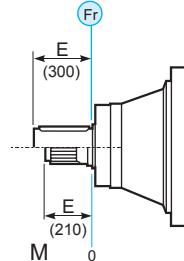

**CARGAS RADIAIS (Fr)**

Nos diagramas seguintes são indicadas as cargas radiais e os coeficientes K para obter o valor requerido  $n_2 \times h$ .

M

	$10^5$	$10^4$	$10^6$	$10^7$	$10^8$
M	Fr		Fr • K		

**CARICHI ASSIALI (Fa)**

I valori dei carichi assiali indicati in tabella sono riferiti alle versioni e alla direzione di applicazione del carico.

**AXIAL LOADS (Fa)**

The values of the axial loads in the table refer to the output versions and load direction of application.

**AXIALLAST (Fa)**

Die dargestellten Werte der Axiallast basieren auf der Version und der applizierten Lastrichtung.

**CHARGES AXIALES (Fa)**

Les valeurs des charges axiales indiquées dans le tableau se réfèrent aux versions et à la direction d'application de la charge.

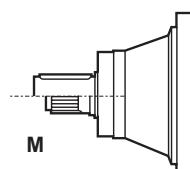

**CARGAS AXIALES (Fa)**

Los valores de las cargas axiales indicados en la tabla se refieren a las versiones y a la dirección de aplicación de la carga.

**CARGAS AXIAIS (Fa)**

Os valores das cargas axiais indicadas na tabela referem-se às versões e à direção de aplicação da carga.

I freni in dotazione ai riduttori epicicloidali Planetary Drives sono di tipo idraulico, con dischi a bagno d'olio, adatti esclusivamente alla fre- natura statica, ovvero di parcheggio.

I freni hanno la lubrificazione separata da quella del riduttore epicicloidale. In fase di immissione del lubrificante bisognerà quindi provvedere anche al riempimento del freno, mediante un apposito foro adduzione olio posto sullo stesso.

Il lubrificante consigliato è un ISO VG 32. Normalmente possono andar bene gli olii idraulici.

Planetary Drives planetary reduction units are equipped with hydraulic brakes with oil-bath disks, expressly designed for static or parking braking.

The lubrication for the brakes is separated from the lubrication of the planetary gear units. Thus, during the lubricant inlet phase, it is necessary to pour the fluid also into the brake through the proper hole mounted on its casing.

We suggest to use lubricant ISO VG 32 (however, hydraulic lubricants can be used as well).

Fuer die Planetengetriebe stehen hydraulische Federdruck-Lamellenbremsen zur Verfuegung. Diese sind ausschliesslich als statische Haltebremsen ausgelegt. Die Lamellen liegen im Oelbad, das vom Oelkreislauf des Getriebes getrennt ist. Deshalb ist beim Befuellen darauf zu achten, dass der Schmierstoff direkt in den Bremskoerper gegeben wird.

In der Regel koennen Hydraulikole verwendet werden. Empfohlener Schmierstoff: ISO VG 32.

Les freins dont sont équipés les réducteurs planétaires Planetary Drives sont du type hydraulique, avec disques en bain d'huile, appropriés exclusivement pour le freinage statique, c'est à dire de stationnement.

Les freins ont une lubrification séparée de celle du réducteur planétaire. Lors de l'introduction du lubrifiant, il est donc nécessaire d'introduire de l'huile par le trou pratiqué sur le corps du frein.

Il est conseillé d'utiliser du lubrifiant ISO VG 32 (on peut utiliser normalement des huiles hydrauliques).

Los reductores epicicloidales Planetary Drives se suministran con frenos de tipo hidráulico, con discos sumergidos en baño de aceite, aptos exclusivamente para el frenado estático o sea, para el estacionamiento.

Los frenos tienen la lubricación separada del reductor epicicloidal. Por tanto, durante la introducción del lubricante también habrá que efectuar el llenado del freno, mediante el respectivo agujero de aducción de aceite que está en su carcasa.

Se aconseja utilizar el lubricante ISO VG 32 (también se pueden utilizar los aceites hidráulicos).

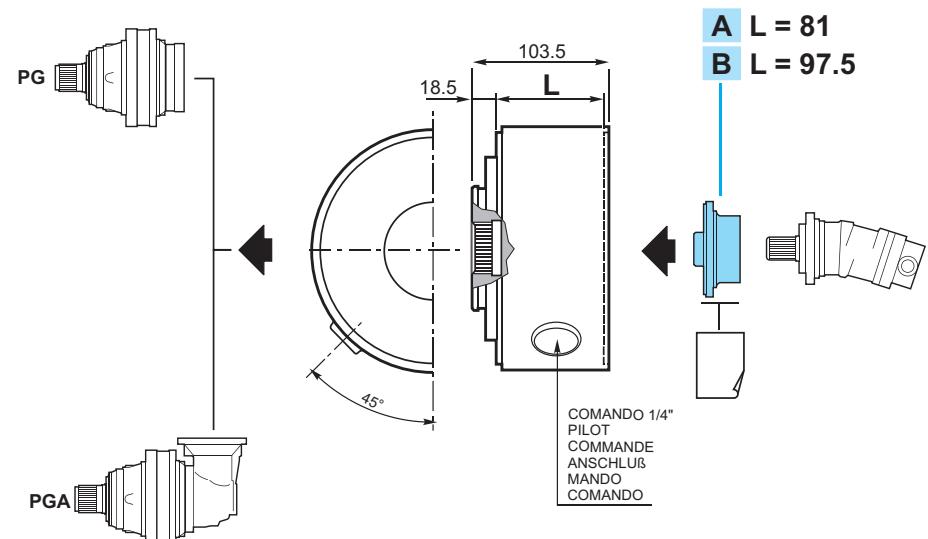

Os freios fornecidos com os redutores planetários Planetary Drives são do tipo hidráulico, com discos em banho de óleo, adequados exclusivamente para a frenagem estática, ou seja, de estacionamento.

A lubrificação dos freios é separada da lubrificação do redutor planetário. No momento de introduzir o lubrificante, é preciso abastecer também o freio através de um furo próprio de distribuição do óleo presente no mesmo.

O lubrificante aconselhado é um ISO VG 32. Normalmente, também podem ser utilizados os óleos hidráulicos.

## PREDISPOSIZIONI PER RIDUTTORI A VITE SENZA FINE

## WORM GEARBOX ADAPTORS

## ANSCHLUSS FÜR SCHNECKENGETRIEBE

Comer Industries può fornire i riduttori combinati nelle seguenti configurazioni:

- 1) Completati di riduttore a vite senza fine.
- 2) Predisposti per riduttori a vite senza fine.

Inoltre ricordiamo che i riduttori epicicloidali hanno la lubrificazione separata da quella del riduttore a vite senza fine.

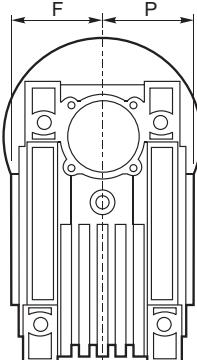

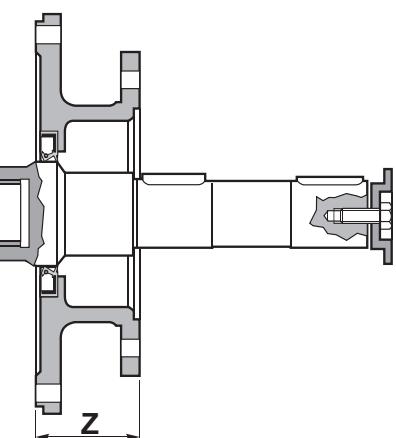

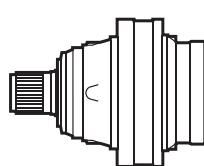

## ADAPTATION POUR REDUCTEURS A VIS SANS FIN

Les réducteurs combinés peuvent être fournis de la manière suivante:

- 1) Equipés d'un réducteur à vis sans fin.
- 2) Equipés pour recevoir un réducteur à vis sans fin.

En outre, nous vous rappelons que le réducteurs planétaires ont une lubrification séparée de celle du réducteur à vis sans fin.

Comer Industries kann kombinierte Getriebe wie folgt liefern:

- 1) komplett mit Schneckengetriebe.
- 2) Vorrichtung für Schnecken- getriebe.

Weiterhin weisen wir darauf hin, das die Schmierung der Planetengetriebe getrennt von der des Schneckengetriebes erfolgt.

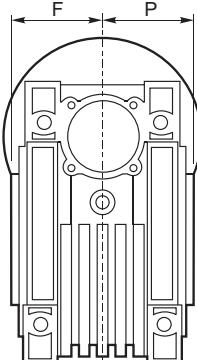

## PREDISPOSIÇÕES PARA REDUTORES DE ROSCA SEM FIM

A Comer Industries pode fornecer os redutores combinados nas seguintes configurações:

- 1) Munidos de redutor de rosca sem fim.
- 2) Com predisposição para redutores de rosca sem fim.

Lembramos ainda que a lubrificação dos redutores planetários é separada da lubrificação do redutor de rosca sem fim.
